Abstract

This article was migrated. The article was marked as recommended.

Background: Developing patient-centred skills in health professional students relies on their learning experiences at the university and on clinical placements. It is not known what students perceive about their teaching on patient-centredness and their views to develop the curriculum in this aspect.

Methods: Multiple focus groups were conducted with students who had experienced a minimum of two clinical placements from Medicine, Physiotherapy, Nursing and Speech and language therapy programs. Thematic analysis was conducted independently by two researchers and then themes were compared and integrated.

Findings: Five focus groups with 26 participants with a mean age of 23.8 years contributed to 286 minutes of recorded data. The key findings were that their curriculum focussing on patient-centred skills used artificial methods and teaching focussed largely on biomedical aspects, but, shared modules and specialist training enabled learning. Longer and diverse placements with good role models to emulate, enabled learning. As strategies they suggested reflections and rolemodelling were vital along with further interprofessional working, goal-setting and understanding of human psychology.

Conclusion: Though the study is limited by its generalisability, strategies suggested by students can be further developed by superimposing them on learning theories. These strategies need to be tested in future studies.

Integration of analysis from two analysts		
1 st analyst		2 nd analyst
	Let's move on. I mean, you've mentioned role models,	
	you've mentioned examples, and where you've	
	learnt, and good strategies of how to be more	
	patient-centred. Is there any other place where you	
	learn patient-centred care from, apart from having	
	role models in the hospital?	
	F: Being a patient ourselves, maybe.	Learning from illness experience
Learning PCC from ourselves [?]	Oh wow.	
	That's a good one.	
	F: That's great.	
	Actually, I think that's probably	
	Putting yourself in the shoes of the patient.	
PCC and empathy		
	F: Yes.	In Patients' shoes

	I think that's probably the only	
	F1: I think it's hard to put yourself in the shoes of a	
Empathy for PCC without direct experience is not	patient unless you've actually been a patient, though.	
possible.	You can't just imagine it. Because we're in hospitals all	
	the time, so you kind of do the imagining, but until	
	you're actually a patient, you don't really know how	
	daunting it feels.	Learning from illness experience
	M2: But I think we can all sympathise and empathise	
Empathy is possible for PCC to some degree.	when we've seen a GP and we can tell they're just so	
	dismissive. I remember, I wasn't even looked at when I	Dismissive practitioners
	asked for something, and they're just, 'Yeah, there you	
	go. Just go'. So we can all empathise to that degree. So	In patient's shoes
	I think, yes, that's a great answer, actually.	
	Any other ways that you've learned to be more	
	patient-centred, or where it's taught to you to be	
	patient-centred?	

Learning PCC through practice, reflection and group	F1: In the GP, in CBM we had - on every Friday we used	
discussion	to have like lecture days, and they did this really good	Lecture on Shared decision
	session about shared decision making, and we had to	making
	make videos of a good consultation and a bad	
	consultation, and I thought that was really useful,	Video-making
	because it wasn't just practicing it, but it was then	Reflections
	reflecting on it together and going through it as a	
	group and being like, 'This is why it was good. This is	Group work
	why it was bad'. So I think that was helpful because I -	
	I've never really been taught how to be patient-	
	centred, it's sort of something that just either comes or	Practitioner's personality
	doesn't come for certain people, so I think, to have it	, ,
	formalised like that, gives you - it points you in the	Formal teaching
	right direction. So that was good, I thought.	
PCC and rules to follow, as not natural for all due to	F3: I quite like having rules to follow, and I know you	Helpful Structure
personal qualities.	shouldn't have just rules, but sometimes all the really	
	obvious things, like you said about patient-centred	Practitioner's personality
	care, wouldn't come naturally to a lot of people,	PC skill not natural
	especially if, when you first come to med school,	
	you've just been out of school, and you've never had a	

Lack of hospital experience job before, all you've been around is your friends. Like I'd never had to speak to members of the public Shy nature before. I was quite shy when I came to med school, so it was quite a big step, so simple things like getting Lack of care experience down to eye level. I'd worked in a care home, but some people would never have been round elderly people before, or children. I guess, for some people, maybe, it would seem really obvious, but just being told those Structured learning things might have been helpful, like at the beginning of third year, because I didn't know, actually, when I first started third year, it didn't twig that you should pull Lack of hospital experience the curtains round when you're talking to a patient, because I'd never been in hospital before, so I didn't know that was the thing. So just someone saying, Lack of experience to provide PCC. 'When you're talking to a patient pulls the curtains round. Get down to eye level'. We get taught about Nonverbal communication Teaching and PCC. communication skills, like what to say, but not necessarily the non-verbal bits of...

	How to behave, yes.	
Teaching and PCC	M1: Yes, they might seem like really small things, but just having them as part of a formal teaching, even a lecture about these things, it keeps	Formal teaching
	F3: Just like when we have like teaching at hospitals in our firms, just like five minutes just to say, 'This is how you should do a consultation', or in the GP, just five	Brief teaching
	minutes at the beginning of your placement, like, 'I	Outline PCC strategies
	tend to get the patient to sit here. I sit here'. I don't know.	
	No, that's really important. I think that's valuable,	
	like, you know.	
	F: Kind of. That's just like how my brain works.	

	No, it's helpful. I think it's helpful as well. Any other ideas or - how has it been taught to you on the course currently? You've given us examples of communication skills and the GP. F3: I don't really feel like we've had	
Role play and learning PCC	M1: The role plays that we've had as part of our - especially the final year GP placement, I found them very engaging and very helpful. So I think, having role plays is one - is another way [?to communicate to	Role play Engaging
	somebody 0:33:08.3].	
Role play focuses on pathology due to time and not PCC	F1: I feel like, from the GP part, the GP stations, when they ask you, they kind of want us to - you know, we are told that we need to focus on asking the patient about their ideas, concerns, and expectations, and I think that's all part of trying to do the shared decision	Exploring patient concerns
	making, and more of a patient-centred model, but then they, in reality, give you ten minutes, they've given you a set of results that you have to give a new diagnosis.	Limited time Exam expectations

	They then want you to explain that diagnosis to the	
	patient, and then you need to create a management	
	plan, and as a student in an exam situation, I'm	
	thinking, right, I need to show what I know about	Focus on pathology
	managing this condition, and suddenly what should be	
	something where the patient's doing at least half the	
	talking	
	M2: Becomes a tick-box exercise.	Tick box exercise
Perceived exam focus on approach 'being nice' not	F1: Me trying to say everything that I know, and then I	Exam expectations
being natural	forget to ask about their ideas, concerns and	Exam expectations
	expectations. I think, they're trying to, almost, examine	
	you on asking - you know, being nice and talking to the	
	patient and asking about their ideas concerning	
	expectations, but I don't think	
	It's hard to be in those very nervous	
		Unnatural behaviour

	F1: It feels very hard in that situation, and I found	
	myself actually behaving in a way which I really - that's	
	not me.	
	M1: It makes it unnatural, in a way.	
	F1: Very unnatural, yes.	
Taught approaches affecting natural approach	M2: That's the thing, don't you find that, as you said,	
	that ICE thing that we always use, don't you think that	Unnatural behaviour
	that makes it artificial, the whole conversation?	
	F: Yes.	
PCC cannot be learnt from books as need experience	M2: I don't think that - I agree with what people are	
and self-reflection	saying in terms of having some rules and things, but	
	the whole point of medicine is that this is supposed to	
	be a human connection between two people, and I	
	don't think - there are some things, for instance you	Cannot be learnt
	could read 1000 books on how to bring bad news, but I	
	don't think that will necessarily make you any better at	

	doing it. I think it's something that you have to	Experiential learning
	experience, and this is - I hate to use the word reflect	Self-reflective learning
	on, but it is something that you just need to, you know,	Sen-reflective learning
	you need to approach and think how could I do that	
	slightly better. It's just	
Consultations feel unnatural but structured	F3: I find that in a consultation, or when I'm clerking a	
reminders help	patient or something, if they've come in with chest	
•	pain, I'm immediately thinking what questions do I	
	have to remember to ask about, because I'm still kind	Disease oriented
	of learning them and it's not natural. It's still not like	
	engrained in me, and ICE is just one of those things,	
	and if I remember it - I know it is artificial, and I don't	
	say, 'Do you have any ideas about what it is?' I don't	
	say that, and it does come way more naturally when	
	the conversation is flowing, but in those consultations	
	or clerking when the patient is so conversational, or it's	
	a really complicated history, little things like that make	Structured learning Reminders
	me remember to ask it.	
		Professional responsibility

	M2: Isn't it odd, though? I mean, we're in a healthcare	Need for reminder
	profession when we work for the benefit of others, and	
	yet we need to be reminded to explore some of these	
	concerns and expectations.	
	F: Very.	
	That's why I find it odd.	
	F: I think, for some people	
	F3: Seeing as we're trying to save their life at the same	
	time.	Focus on disease
	M2: In a ten-minute clerking, I don't think you're saving	
	their life, I think you're just - it just seems odd to me	Reminders are odd
	that we need prompting.	
Frameworks help people be more PCC.	F3: But I think, maybe for you, you're just the sort of	
	person that would do that anyway, but I think a lot of	Practitioner's personality
	people aren't, and so, by having that framework to	
	proprie area of and so, a, maxing and marine work to	Structured learning

	work by, it aids a lot of people in being more patient-	
	centred.	
Having responsibility helps to remind people of the	F2: Then it will be built on - like we've only been at	
what is needed, as not natural	med school for five years. Like people have been in	
	hospital a variety of amounts over the last three years,	
	and we've never had the direct responsibility, and I	Direct responsibility
	think once you start having the responsibility of	
	thinking, oh my God, I have to actually figure out what	
	chest pain is, and deal with their blood results, having	Focus on disease
	just a little thing to remind you to ask - it just won't	PCC not a natural skill
	come naturally to other people, as it does to	
	M2: Well, I think that I just find that there are two	
	separate issues: investing the chest pain, and me just	
	asking them what they're concerned about. I don't see	
	why they're somehow	
	F3: I think that's just you. Like some people just	
	M2: Yes. I think it's a very personal thing, basically.	Practitioner's personality

Natural approach and PCC and personality linked	F2: Yes, it comes from also just naturally how you	
with PCC.	approach a person to begin with, whether you're in a	Variable social skills
	hospital and working or whether you're meeting a new	
	group of people socially; everyone approaches people	
	in completely different ways, don't they? They have	
	sort of safety nets they go to. Some people will sort of	Practitioner's personality
	get someone to spill their heart out in a few minutes of	
	conversation, or other people feel very, very awkward	
	in that circumstance and it takes a lot more to actually	
	bridge those sorts of conversations, so it just depends.	
	It's all about personality. You said you were quite shy	
	when you started off, when you came into medicine. I	
	don't think D was ever shy.	
	M2: No	
Personality helps PCC but a framework or guidelines	No, I'm just saying. It's a little bit of what comes across	
can too.	here is it's down the person, so it's a bit of personality.	
	It can be nudged, it can be increased, it can be	Nudging personality
	developed with a little bit of structured framework.	Personality development

	Obviously, then bits within your personality, the	Helpful Structure
	framework or ground rules or guidelines that you're	
	given.	
		Paternalistic practioners
Personal approach observed in practice.	F3: That's what I was saying as well. So some doctors	
	have a more paternalistic viewpoint, and some are	Observing PC practice
Framework helps those not naturally PCC.	completely different to that, and I think you can	
	observe people and see how people do it differently,	Helpful Structure
	and I think it's quite a personal thing, and it depends	
	on the doctor as well. So if we have more of a	
	framework to stick to, it does help those who are	
	maybe not so patient-centred naturally.	
		Self -awareness
Self-awareness affects PCC	F1: I think, maybe, also, actually, people need to have	
	awareness of their own self and how they interact with	
	people.	
	M2: Yes, I agree.	
Course lacking exploration of patient interactions	F1: I think that's probably what's missing from the	
and own levels of confidence and approaches.	course, is actually thinking about, okay, what situations	
		Reflective learning

	do I feel comfortable in, how would I naturally interact	Varied circumstances
	with people in different circumstances, and actually,	
	for me, what's important to remember in	Understanding personalities
	circumstances, because the other person you're	01
	interacting with in hospital is also their own person	
	who also interacts in their own way as well, and you	Self-awareness
	need to have an understanding of yourself before you	
	can really tailor yourself to work with someone else.	
Lack of teaching about personality, its impact on	F2: It's weird that we don't get taught anything, really,	
interactions with patients, and generally about	about personalities and stuff, because our whole job is	Lack of structured teaching
human nature.	interacting with personalities and finding out patients'	Knowledge of personality/natures
	concerns and stuff. I find it comes quite naturally if a	personanty/natures
	patient is anxious, you can, obviously, think, okay, so	Anxious patient
	what's concerning you, but someone who's like shut up	Reserved patient
	and is like, I just want this done, they might have major	neserved patient
	problems going on that you don't know about because	
	they don't come across that way, and it's a bit weird	Focus on disease
	that we don't get taught anything about human nature,	
	when our entire job is about	Knowledge of human natures

	F1: I'm a graduate entry, and we had, right at the end	
	of the year, we did the Myers Briggs personality thing,	
	and we did have a session of talking about	
	F2: Really?	
	F1: Yes, how we sort of come across.	Understanding self
The importance of underrating oneself for PCC.		
	F2: I think that would help in just like studying and	
	stuff, so like understanding more about yourself. This is	Understanding self
	getting very deep, isn't it? Because then you can reflect	
	more in situations, because there's, obviously, so many	Self-reflection
	different personalities in medicine, and everyone can	
		Varying personalities
	still be patient-centred, but I think it wouldn't	,, personanties
	necessarily be the same way. Like someone might find	
Natural PCC inclinations. Formulaic approaches and	it very natural to ask about concerns, and they might	
still be effective. Can be shown how to be PCC.	do that conversationally, but that doesn't mean that	PCC Tangible for all
	someone who has to remember to ask about it in a	personalities
	more formulaic way at the end can't still deliver	
	patient-centred care. So it wouldn't have to be like one	

No one size fits all size fits all, but it's more like we understood more about how we feel most comfortable interacting with Understanding self people, then people wouldn't necessarily feel like No shoe-horning they're being shoe-horned into like - because some PC not a natural skill people aren't really like - they're quite empathetic, you have to be a bit, but some people, it just doesn't come Structured learning naturally, but they can be shown how to be patientcentred in a way that isn't necessarily the same as other things. Teaching experiences about PCC important as M1: I completely agree that it's something that you **Experiential learning** experiences vary and cannot be planned. have to experience, but because a large med school like us, you can't really control what students are going **Uncontrolled experiences** to experience on a day-to-day basis in the hospital. It's Formal teaching one way of, perhaps, giving the same type of teaching Basic framework to everyone, so that everyone has at least a similar Role models background, and they can see different role models, different examples in the hospitals. I think that's why I Formal teaching said having some form of formal teaching.

Importance of self-reflection to develop PCC.	F3: I think what D was saying about reflection, though,	Reflections
	as well, actually just at some point having a think about	
	circumstances where you felt really uncomfortable	
	because some sort of communication wasn't going	
	right, and actually just having a sit down and a think	
	about, okay, so why didn't I feel comfortable in that	
	situation. You know, was it that I was watching a	
	situation that was going wrong, or was I actually	Self realisation
	involved in the communicating in that, and what could	
	have been done better, and that kind of thing. A lot of,	
	I guess, people skills, does come from actually just	Experiential learning
	experience.	
Protected time to reflect and discuss with supervisor	F2: In psychiatry, psychiatry trainees have like - well,	
helps develop PCC.	when I was on my elective, they have like an hour a	Psychiatry as exemplar
	week of protected time when they talk with their	Mentor discussions
	consultant and they talk about	Wester discussions
	F1: Supervision.	

	F2: Supervision, yes. I mean, you kind of have tutors on	Inadequate supervision
		madequate supervision
	placement, but they kind of just ask whether things are	
	going all right, but I don't know, if people were a bit	Mentor discussions
	more aware of things and said - I guess, if you had the	
	opportunity to talk about consultations you'd had that	Reflective discussions
	felt like a bit uncomfortable - yes, you kind of do that in	
	GP, I guess, but it is useful to like talk through it.	
Videoing approach to gain insight.	M1: I think we did something called video	
	consultations in family GP. I found them very helpful,	Videoing consultations
	because I think the best way to kind of get an insight	
	into your own weaknesses is by getting some one-to-	Mentor feedback
	one feedback. It's all good learning about all of these,	
	but you might not realise that you're not doing	
	something, or you're doing something wrong, and it's	
	very difficult to know that, unless you get some	
	feedback from someone else.	
	Can I just ask, when you were on placement, do you	
	get individual feedback on your performances?	

	F1: No.	
	F2: Rarely. I mean, we have like senior academy tutors, but	Inadequate mentoring
	F1: They don't see us in the clinical environment.	Mentoring gaps
	M2: Unless you request it from somebody you're shadowing.	
	F1: I met mine once.	Inadequate mentoring
	Is that something you're going to ask, 'Oh, can you watch me talk to'? In the second year GP they might	Student's reluctance
Lack of feedback in practice on communication	F3: You don't get feedback on like communication	Feedback on communication
approach.	either. So there are doctors, they say, 'Oh, go and present her history', so you're saying your history a doctor, and they'll say, 'Oh, did you ask about change	Focus on disease

	in the stool colour?', or something, and they'll talk about the things that you didn't ask them about, but no one will have watched you do the talking, so you don't know if you've communicated well. That's quite important.	Gaps in mentoring
One-to-one feedback from a mentor.	F3: You do that a bit more in third year, but once you get to fifth year it's kind of like just expected.	Expectation from final years
	F2: There's a few situations I've had where I have had one-to-one feedback, but it's much rarer than	Feedback from mentor
	Those situations were about interaction, or about your knowledge?	
Observation and feedback in practice.	F2: So one was a junior doctor who watched me take a history from - it was a paediatric rotation, and he watched me take a history from a girl who was suicidal.	Experiential learning Feedback
	So that was quite useful feedback, because it wasn't the easiest communication. The other was actually talking to a family of a relative who had died and I'd	Experiential learning

been with him when they died, and they wanted to	
speak to me because I'd been the last person to see	One-one feedback
him, and so I had a doctor come in with me, because	
that was a pretty scary situation, and I got the	
feedback on that, mainly because that was something	Grim experience
that needed to be talked about, kind of would it have	Community
been okay to have just sent me home after that. But	Compulsory situation
they weren't really everyday situations, and they were	Grim experience
just situations that I found myself in without really ever	·
having sort of planned - I know proactive people, as	Proactive mentors
well, who were offering to come with me.	
So that's not a routine thing that happens. How are	
we with time?	
F3: I think we might have to go.	
Yes.	

Multicultural experience helps view more widely.	Okay. I think I've got through most of the questions. Is there anything else you need to add about your concepts, how you're being taught, how you can be taught better? Anything at all?	
Wideleditara experience neips view more widery.	F3: The only other thing I would say is, I think we're	Multicultural society
	really lucky being in Birmingham, because there's such a sort of cultural variety that, actually, it almost sort of	Cultural variety
	- because everybody likes to be cared in different ways, and I've had lots of people want different things, it	Exploring wishes
	makes you ask people, 'Actually, what are your wishes.	Exploring concerns
	How would you like this done? Is this okay for you?'	
	and I think that's key. I grew up in Cambridge, and I think it would be very different being a medical student	Cultural variety
	there, with much less variety in the community.

I comment the authors for conducting this study on patient-centred care and I agree that their learning experiences influence how they acquire these skills. I might venture to say that clinical placements more strongly impact increase in PCC skills than university based learning, as the hidden and informal curricula are more important than the formal curriculum. What they learn at the university as part of their formal curriculum can either be reinforced and enhanced or undone by what they learn in their clinical experiences. Given the caring model emphasized by nursing education, there is a lot to be said for interprofessional learning especially for medical students. If medical students are not engaged with other professionals, they might continue to assume that the science based or task based learning are more important- based on social constructivist theoretical principles. The problem statement is well written and real, study objective is clear and the mixed methods adopted are appropriate. The authors justify data collection methods and they purposively sampled a variety of health professional students. Ethical approval was obtained. The authors collected focus group data with rigour- after piloting, conducted by a researcher with no affiliation to the programme and observed by another researcher and both were educationalists. Data analysis is clearly described and cited. The authors describe their qualitative analysis step by step which will enhance dependability and transferability. The themes are very well described and quotes are representative of themes. I like the fact that one of the themes focussed on strategies to design PCC. The theme related to role-modelling is not surprising and it is good to see that students recognized its importance. The central importance of engaging patients as teachers is another critical theme.I like the emphasis on role-modelling and interprofessional learning in the discussion section, and agree with the limitations as noted. The authors have demonstrated rigour in several ways- triangulation, piloting, member checking etc. I enjoyed reading this well written paper very much as it deals with an important topic and outlines strategies for other health professions educators to enhance PCC very clearly. I would say that these findings and recommendations are important to all health professions

educators whether they are involved in designing PCC or not. Regardless of their educational role, they are all role-models and need to be conscious about their communication skills with learners, other teachers, patients, families of patients and all healthcare professionals.

Interesting article, since patient centered care is important component of the recent curriculum within our country. Every aspect of the article was clear and well explained. In methodology data collection and analysis was explained in detail. Majority of themes and sub-themes framed were interesting. I liked the theme "Role models & interprofessional learning" highlighting the scarcity of positive role models, particularly in medical schools. Working with other professionals enabled students to develop a holistic understanding of patients' needs, which in my opinion, will allows students to communicate well with the patient thus have better patient care. This approach, probable, would create good repo among the student and patient. Discussion was well written, although a question, as already asked by one of the reviewer, was there difference of opinion as per the age of the students' since there were young and middle aged students. Over all I enjoyed reading it.

Competing Interests: No conflicts of interest were disclosed.

This article provided students' perceptions of their learning on person-centred care and their recommendations from different disciplines. The background introduction part was clear, with relevant literature. The methods section was well-described. Readers can follow the authors' process easily. DiscussionNot a comment but rather a question. There were several mature students in this study. Should they use the same framework, compared to younger students? Strengths/limitations The strengths and limitations were well described. I would not worry about the issue of generalisability since this is the qualitative study and the findings will be in-depth and relevant on that context with that participants and researchers. Data checking was also a good way to improve the rigour but the authors already have other methods in place so it was fine and robust. This article will be of interest to educators and healthcare professionals who are involved with interprofessional educations, curriculum developments, curriculum evaluation, and professionalism.

Competing Interests: No conflicts of interest were disclosed.

This is an interesting and detailed study examining the teaching-learning of patient-centered care at a university in the UK. The authors have examined the perceptions of students of medicine, nursing, physiotherapy and speech and language therapy. The authors have provided a detailed description of the methodology of the study. The results section is comprehensive and detailed insights have been obtained both regarding the strengths of the program and how to further strengthen areas of weakness. The free-text comments are the strength of the study. I enjoyed reading them. The limitations have also been mentioned. The study will be of interest to most medical educators as patient-centered care is becoming an increasingly important component of the curriculum.
