A B S T R A C T

Let $R$ be a cyclic group of prime order which acts on the extraspecial group $F$ in such a way that $F=[F, R]$. Suppose $R F$ acts on a group $G$ so that $C_{G}(F)=1$ and $(|R|,|G|)=1$. It is proved that $F\left(C_{G}(R)\right) \subseteq F(G)$. As corollaries to this, it is shown that the Fitting series of $C_{G}(R)$ coincides with the intersections of $C_{G}(R)$ with the Fitting series of $G$, and that when $|R|$ is not a Fermat prime, the Fitting heights of $C_{G}(R)$ and $G$ are equal.

## 1. Introduction

If a group $A$ acts on a group $G$ in such a way that $C_{G}(A)=1$, then one can often say something about the structure of $G$ given properties of $A$. For example, due to a result of V. Belyaev and B. Hartley [1, Theorem 0.11], if $A$ is nilpotent, then $G$ is soluble. It was conjectured by J. Thompson [11] that the Fitting height of a soluble group $G$, denoted $f(G)$, is bounded by a function of the order of one of its Carter subgroups (a Carter subgroup is a self-normalising nilpotent subgroup, and in any soluble group there is a single conjugacy class of such subgroups). It is applicable here since if a nilpotent group $A$ acts on a group $G$ so that $C_{G}(A)=1$, then $A G$ is a soluble group and $A$ is a

[^0]Carter subgroup. J. Thompson proved his conjecture in the case where $(|A|,|G|)=1$. The bounds he obtained were improved in numerous papers that followed, most notably, linear bounds were found by H. Kurzweil [9] and best-possible by A. Turull [13]. This conjecture is a special case of the more general Fitting height conjecture, which can be stated as follows:

Let $A$ be a group which acts on the soluble group $G$ so that $C_{G}(A)=1$. Then the Fitting height of $G$ is bounded above by the length of the longest chain of subgroups in $A$.

This has been largely settled when $A$ is soluble of coprime order to $G$; many of these results are collected in [12]. Much of the recent work towards settling the Fitting height conjecture when $|A|$ is not assumed to be coprime to $|G|$ has concerned when $A$ is cyclic. For example, it has been proved when $A$ is cyclic of order a product of two and three distinct primes by K. Cheng [2] and G. Ercan and İ. Güloğlu [5] respectively. Further work has been done by G. Ercan in [3], where $A$ is cyclic of order $p^{n} q$ for primes $p$ and $q$ greater than 3 and $n \in \mathbb{N}$.

However, E. Khukhro has taken a slightly different approach, and has considered the case where $A$ has a nilpotent subgroup $B$ so that $C_{G}(B)=1$ and has asked: Can we bound the Fitting height of $G$ in terms of how elements outside of $B$ act on $G$ ? In particular, he has considered the case where $A$ is a Frobenius group and has proved the following:

Theorem 1.1 (Khukhro). Suppose that a finite group $G$ admits a Frobenius group of automorphisms $F H$ with kernel $F$ and complement $H$ so that $C_{G}(F)=1$. Then:

1. $F_{i}\left(C_{G}(H)\right)=F_{i}(G) \cap C_{G}(H)$ for all $i$; and
2. $f(G)=f\left(C_{G}(H)\right)$.

Proof. See [7, Theorem 2.1].
Since Frobenius kernels are nilpotent, E. Khukhro is still considering the situation where a nilpotent group acts fixed-point-freely on a group $G$, but there is also an 'additional' action which comes from the complement $H$; and indeed it is in terms of the action of this complement that he obtains structural information about $G$, namely, that its Fitting height is equal to that of the fixed-point subgroup of $H$.

In what follows, we also consider the situation where a group $A$ acts on a group $G$ in such a way that for some nilpotent subgroup $B<A$, we have $C_{G}(B)=1$, and we obtain structural information about $G$ in terms of how elements outside of this nilpotent subgroup act on $G$. Namely, we prove the following:

Theorem 1.2. Let $R \cong \mathbb{Z}_{r}$ for some prime $r$ and $F$ be extraspecial. Suppose that $R$ acts on $F$ in such a way that $F=[F, R]$, and that $R F$ acts on a group $G$ so that $C_{G}(F)=1$ and $(r,|G|)=1$. Then $F\left(C_{G}(R)\right) \leq F(G)$.

From this we obtain the following corollaries which reflect more obviously the recent work of E. Khukhro.

Corollary 1.3. Let $R \cong \mathbb{Z}_{r}$ for some prime $r$ and $F$ be extraspecial. Suppose that $R$ acts on $F$ in such a way that $F=[F, R]$, and that $R F$ acts on a group $G$ so that $C_{G}(F)=1$ and $(r,|G|)=1$. Then $F_{i}\left(C_{G}(R)\right)=F_{i}(G) \cap C_{G}(R)$ for all $i$.

Corollary 1.4. Let $R \cong \mathbb{Z}_{r}$ for some non-Fermat prime $r$ and $F$ be extraspecial. Suppose that $R$ acts on $F$ in such a way that $F=[F, R]$, and that $R F$ acts on a group $G$ so that $C_{G}(F)=1$ and $(r,|G|)=1$. Then $f\left(C_{G}(R)\right)=f(G)$.

It should be mentioned that by a theorem of A. Turull [13], we already have that $f(G) \leq f\left(C_{G}(R)\right)+2$, even without any $F$.

In Section 2 we set some notation and recall some results which will be needed in the proof of Theorem 1.2. We will then prove Theorem 1.2 and Corollaries 1.3 and 1.4 in Section 3. The proof of Theorem 1.2 proceeds by considering a counterexample with $|R F G|$ minimal. A series of reductions are made until we find that $G=Q V$ where $Q$ is an $R F$-invariant Sylow $q$-subgroup of $G$, and $V=F(G)$ is minimal normal in $R F G$. Hence, $V$ is an irreducible $\mathbb{F}_{p}[R F Q]$-module on which $Q$ acts faithfully. We then consider $\bar{V}$, which we take to be an irreducible $k[R F Q]$-submodule of $W=V \otimes_{\mathbb{F}_{p}} k$ where $k$ is a splitting field for $R F Q$. This is also a module on which $Q$ acts faithfully. We obtain a contradiction by finding that the nontrivial subgroup $1 \neq O_{q}\left(C_{G}(R)\right) \subseteq Q$ acts trivially on $\bar{V}$.

After the present paper was submitted, the authors were informed by the referee about a recent paper by G. Ercan and İ. Güloğlu [4]. Here they consider a soluble finite group $G$ admitting a 'Frobenius-like' group of automorphisms $F R$ of odd order such that $\left|F^{\prime}\right|$ is of prime order, $C_{G}(F)=1$, and $(|G|,|R|)=1$. ('Frobenius-like' means that $F$ is a nilpotent normal subgroup and $F R / F^{\prime}$ is a Frobenius group with Frobenius kernel $F / F^{\prime}$ and complement R.) Theorem A of that paper asserts that $F_{i}\left(C_{G}(R)\right)=F_{i}(G) \cap C_{G}(R)$ for all $i$ and $f\left(C_{G}(R)\right)=f(G)$. These results are of course very similar to Corollaries 1.3 and 1.4 of the present paper. They are more general in the sense they do not require $R$ to be of prime order, but less general in their stipulation that $R F$ must be of odd order. Furthermore, the authors were also made aware that [4] contains Proposition C, which can be used to significantly shorten the proof of Theorem 1.2 of the present paper. This proposition is as follows.

Proposition 1.5 (Ercan-Güloğlu). Let FH be a Frobenius-like group such that $F^{\prime}$ is of prime order and $\left[F^{\prime}, H\right]=1$. Suppose that $F H$ acts on a q-group $Q$ for some prime $q$ coprime to the order of $H$. Let $V$ be a $k Q F H$-module where $k$ is a field with characteristic not dividing $|Q H|$. Suppose further that $F$ acts fixed-point freely on the semidirect product VQ. Then we have

$$
\operatorname{Ker}\left(C_{Q}(H) \text { on } C_{V}(H)\right)=\operatorname{Ker}\left(C_{Q}(H) \text { on } V\right)
$$

We will make it clear later how Proposition 1.5 can be used to shorten the proof of Theorem 1.2.

## 2. Preliminaries

Let $G$ be a group. Then the Fitting subgroup, denoted $F(G)$, is the largest normal nilpotent subgroup of $G$. If we set $F_{0}(G)=1$ and $F_{1}(G)=F(G)$, then we define $F_{i}(G)$ to be the full inverse image of $F\left(G / F_{i-1}(G)\right)$ in $G$, for $i \geq 1$. Note that if $G$ is soluble, then there exists $n \in \mathbb{N} \cup\{0\}$ such that $F_{n}(G)=G$, and the smallest such $n$ is called the Fitting height of $G$. We denote this by $f(G)$.

The Frattini subgroup, denoted $\Phi(G)$, is defined to be the intersection of all maximal subgroups of $G$. We note that $\Phi(G) \subseteq F(G)$, and if $G \neq 1$, then $\Phi(G) \neq F(G)$. Also, for $N \unlhd G$, we have $\Phi(N) \subseteq \Phi(G)$.

The next couple results highlight some very useful properties of the Fitting and Frattini subgroups.

Lemma 2.1. Let $G$ be a p-group such that $Z(\Phi(G)) \leq Z(G)$. Then $\Phi(G) \leq Z(G)$.
Proof. Let $\bar{G}=G / Z(G)$ and let $N$ be the inverse image of $\Omega_{1}(Z(\bar{G}))$. We obtain that $[N, \Phi(G)]=1$. In particular, $N \cap \Phi(G) \leq Z(\Phi(G))$, and so by hypothesis, $N \cap \Phi(G) \leq$ $Z(G)$. Then $\Omega_{1}(Z(\bar{G})) \cap \overline{\Phi(G)}=1$. As $\overline{\Phi(G)} \unlhd \bar{G}$ and $\bar{G}$ is a $p$-group, this implies $\overline{\Phi(G)}=1$.

The following is a well-known generalisation of a theorem of Gaschütz [10, Theorem 1.12].

Lemma 2.2. Let $X$ be a group and $G \unlhd X$. Set

$$
V=F(G) /(\Phi(X) \cap G)
$$

1. $V=F(G /(\Phi(X) \cap G))$;
2. $V$ is a completely reducible $X$-module, possibly of mixed characteristic (by which we mean $V=V_{1} \oplus \cdots \oplus V_{n}$ where for each $i$ there exists a field $\mathbb{F}_{i}$ such that $V_{i}$ is an $\mathbb{F}_{i}[X]$-module $)$.

One of the hypotheses of Theorem 1.2 is that the extraspecial group $F$ acts on the group $G$ so that $C_{G}(F)=1$. The nilpotence of $F$ here not only tells us that $G$ is soluble, but also gives very useful information about the action of $F$ on the Sylow subgroups of $G$ and $G / N$ for some $F$-invariant normal subgroup $N \unlhd G$.

Theorem 2.3 (Belyaev-Hartley). Let $A$ be a finite nilpotent group which acts on a finite group $G$ so that $C_{G}(A)=1$. Then $G$ is soluble.

Proof. See [1, Theorem 0.11].

Lemma 2.4. Suppose that a finite group $G$ admits a group $R F$ of automorphisms where $R F$ is the split extension of the nilpotent group $F$ by $R$. Suppose further that $C_{G}(F)=1$. Then there is a unique RF-invariant Sylow p-subgroup of $G$ for each prime $p \in \pi(G)$.

Proof. See [8, Lemma 2.6].
Lemma 2.5. Let $G$ be a finite group admitting a nilpotent group $F$ of automorphisms such that $C_{G}(F)=1$. If $N$ is a normal $F$-invariant subgroup of $G$, then $C_{G / N}(F)=1$.

Proof. See [8, Lemma 2.2].
Throughout the proof of Theorem 1.2, we will often encounter the action of $R F$ on some direct product. We now set some notation and state some results which will be very useful to us when considering these actions.

Definition 2.6. Let $G$ be a group which acts on the set $\Omega$. Then we define:

1. $\operatorname{Mov}_{\Omega}(G)=\left\{\alpha \in \Omega \mid \alpha^{g} \neq \alpha\right.$ for some $\left.g \in G\right\}$; and
2. $\operatorname{Fix}_{\Omega}(G)=\left\{\alpha \in \Omega \mid \alpha^{g}=\alpha\right.$ for all $\left.g \in G\right\}$.

Lemma 2.7. Let $R G$ be a group and $V$ an irreducible $R G$-module on which $G$ acts faithfully. Suppose $V=V_{0} \oplus \cdots \oplus V_{n}$ where each $V_{i}$ is a $G$-submodule of $V$. Let $H \leq R G$ be such that $H \subseteq C_{G}\left(V_{1} \oplus \cdots \oplus V_{n}\right)$ and $G=\left\langle H^{R G}\right\rangle$. Then $G=G_{0} \times \cdots \times G_{n}$ where $G_{i}=C_{G}\left(V_{0} \oplus \cdots \oplus V_{i-1} \oplus V_{i+1} \oplus \cdots \oplus V_{n}\right)$.

Proof. First note that $H \subseteq G_{0}$. Let $x \in R G$, and suppose $V_{0}^{x}=V_{i}$. Let $h \in H$ and $v \in V_{j} \neq V_{i}$. Then $v^{x^{-1}} \in V_{k} \neq V_{0}$, and so $\left[v^{x^{-1}}, h\right]=1$. Hence $v^{h^{x}}=v$. Therefore, $h^{x} \in G_{i}$, and so we obtain that $G=\left\langle H^{R G}\right\rangle \subseteq G_{0} \cdots G_{n}$. Note that each $G_{i}$ is normal in $G$ as the kernel of an action. Suppose there exists an $i$ such that $G_{i} \cap \prod_{j \neq i} G_{j} \neq 1$, and let $1 \neq g \in G_{i} \bigcap \prod_{j \neq i} G_{j}$. Then $g$ centralises $V_{0} \oplus \cdots \oplus V_{i-1} \oplus V_{i+1} \oplus \cdots \oplus V_{n}$ since $g \in G_{i}$, and centralises $V_{i}$ since $g \in \prod_{j \neq i} G_{j}$. Thus $g$ is a nontrivial element of $G$ which centralises $V$. This is a contradiction since $V$ is a faithful $G$-module. Thus $G=G_{i} \times \prod_{j \neq i} G_{j}$. By induction it follows that $G=G_{0} \times \cdots \times G_{n}$.

Lemma 2.8. Let $G$ be a group which acts on a group $H=H_{0} \times \cdots \times H_{n}$ in such a way that $C_{H}(G)=1$ and for each $H_{i} \in\left\{H_{0}, \ldots, H_{n}\right\}$ and $g \in G$ we have $H_{i}^{g} \in\left\{H_{0}, \ldots, H_{n}\right\}$. Let $G_{0}=N_{G}\left(H_{0}\right)$. Then $C_{H_{0}}\left(G_{0}\right)=1$.

Proof. Note that by induction, we may assume that $G$ is transitive on $\left\{H_{0}, \ldots, H_{n}\right\}$. Now let $T=\left\{g_{0}, g_{1}, \ldots, g_{n}\right\}$ be a set of representatives for the right cosets of $G_{0}$ in $G$. Suppose $C_{H_{0}}\left(G_{0}\right) \neq 1$, and choose $1 \neq h \in C_{H_{0}}\left(G_{0}\right)$. Let $\hat{h}=\prod h^{g_{i}}$. We claim that $\hat{h}$ is fixed by $G$.

First note that elements in a common coset of $G_{0}$ in $G$ act in the same way on $h$. Let $g_{i}^{\prime} \in G_{0} g_{i}$, so $g_{i}^{\prime}=g g_{i}$ for some $g \in G_{0}$. Then $h^{g_{i}^{\prime}}=h^{g g_{i}}=h^{g_{i}}$.

Now notice that the $h^{g_{i}}$ commute. This follows since for distinct $g_{i}, g_{j} \in T, h^{g_{i}}$ and $h^{g_{j}}$ lie in distinct $H_{k}$. For any $g \in G$, the set $T g$ is another set of representatives for $G_{0}$ in $G$. Therefore, $\left\{h^{g_{i} g}\right\}=\left\{h^{g_{i}}\right\}$. Hence, $\hat{h}^{g}=\left(\prod\left\{h^{g_{i}}\right\}\right)^{g}=\prod\left\{h^{g_{i} g}\right\}=\prod\left\{h^{g_{i}}\right\}=\hat{h}$ since the $h^{g_{i}}$ commute.

We now finish this section by outlining some of the representation theoretic results which we will require throughout Section 3.

Lemma 2.9. Let $A=\langle a\rangle$ be a cyclic group which acts semiregularly on the abelian group $N$. Let $V$ be a faithful $\mathbb{F}[A N]$-module where $A N$ is the split extension of $N$ by $A$. Assume that $\operatorname{char}(\mathbb{F})$ and $|N|$ are coprime and $C_{V}(N)=0$. Then $V_{A}$ is free.

Proof. This is a special case of [7, Lemma 1.3].

Theorem 2.10 (Flavell). Let $r$ be a prime, $R \cong \mathbb{Z}_{r}$ and $P$ an $r^{\prime}$-group on which $R$ acts. Let $V$ be a faithful irreducible RP-module over a field of characteristic $p$ such that $C_{V}(R)=0$. Then either:

1. $[R, P]=1$; or
2. $[R, P]$ is a nonabelian special 2 -group and $r=2^{n}+1$ for some $n \in \mathbb{N}$.

Proof. See [6, Theorem A].

## 3. Proof of the main result

The main aim of this section is to prove Theorem 1.2.
Let $R \cong \mathbb{Z}_{r}$ for some prime $r$ act on the extraspecial $s$-group $F$ in such a way that $F=[F, R]$. Then, clearly, $r \neq s$ and $C_{F}(R) \subseteq \Phi(F)$. In what follows we will show that if $R F$ acts on a group $G$ so that $C_{G}(F)=1$, then $F\left(C_{G}(R)\right) \subseteq F(G)$. The proof will proceed by considering a minimal counterexample $R F G$. Thus we must have $C_{F}(R)=Z(F)$. Otherwise $C_{F}(R)=1$; but we know that a counterexample does not exist in this case by Theorem 1.1. Hence, we will establish Theorem 1.2 by proving the following:

Theorem 3.1. Let $R \cong \mathbb{Z}_{r}$ for some prime $r$ and $F$ be an extraspecial s-group. Suppose that $R$ acts on $F$ in such a way that $[R, Z(F)]=1$ and $R F / Z(F)$ is a Frobenius group. Suppose further that RF acts on a group $G$ so that $C_{G}(F)=1$ and $(r,|G|)=1$. Then $F\left(C_{G}(R)\right) \leq F(G)$.

Proof. Since $F$ is nilpotent, the condition $C_{G}(F)=1$ forces $G$ to be soluble by Theorem 2.3. We begin by considering a counterexample with $|R F G|$ minimal. So $F\left(C_{G}(R)\right) \nsubseteq F(G)$. For notational purposes set $X=R F G$, so $G \unlhd X$.

Lemma 3.2. With $G$ and $X$ as above, we obtain that $F(G)$ is a completely reducible $X$-module.

Proof. We know by Lemma 2.2 that $F(G) /(\Phi(X) \cap G)$ is a completely reducible module for $X$. We work to show that $\Phi(X) \cap G=1$. Suppose that $\Phi(X) \cap G \neq 1$ and set $\bar{G}=$ $G /(\Phi(X) \cap G)$. By minimality, we have $F\left(C_{\bar{G}}(R)\right) \leq F(\bar{G})$. We also have by Lemma 2.2 that $\overline{F(G)}=F(\bar{G})$. Now $\overline{F\left(C_{G}(R)\right)} \leq F\left(C_{\bar{G}}(R)\right)$, and so $\overline{F\left(C_{G}(R)\right)} \leq \overline{F(G)}$. Hence

$$
F\left(C_{G}(R)\right)(\Phi(X) \cap G) \leq F(G)(\Phi(X) \cap G)=F(G)
$$

However, this is a contradiction since $F\left(C_{G}(R)\right) \nsubseteq F(G)$.
Lemma 3.3. There exists a prime $p$ such that $F(G)=O_{p}(G)$ is an irreducible $X$-module.
Proof. We know from Lemma 3.2 that $F(G)$ is a completely reducible $X$-module. Suppose that $F(G)$ is not an irreducible $X$-module, and let $U$ and $V$ denote two distinct irreducible $X$-submodules. Clearly, $U \cap V=1$. Therefore, $G$ embeds into $G / U \times G / V$ by the injective map given by $\phi(g)=(g U, g V)$.

Now let $\bar{G}=G / U$. Then $\overline{F\left(C_{G}(R)\right)} \leq F\left(C_{\bar{G}}(R)\right) \leq F(\bar{G})$ where the inclusion on the right follows by minimality. Thus it follows that $\overline{\left\langle F\left(C_{G}(R)\right)^{G}\right\rangle} \leq F(\bar{G})$. Similarly, if we set $\bar{G}=G / V$, then $\overline{\left\langle F\left(C_{G}(R)\right)^{G}\right\rangle} \leq F(\bar{G})$. So the image of $\left\langle F\left(C_{G}(R)\right)^{G}\right\rangle$ under $\phi$ is nilpotent. However, since $\phi$ is injective, $\left\langle F\left(C_{G}(R)\right)^{G}\right\rangle$ must also be nilpotent. So $\left\langle F\left(C_{G}(R)\right)^{G}\right\rangle \subseteq F(G)$, since $\left\langle F\left(C_{G}(R)\right)^{G}\right\rangle \unlhd G$. This is a contradiction since $F\left(C_{G}(R)\right) \nsubseteq F(G)$.

For notational purposes set $F(G)=V$.

Lemma 3.4. There exists a nontrivial RF-invariant Sylow $q$-subgroup $Q$ of $G$ such that $G=Q V$ for some prime $q \neq p$.

Proof. Set $\bar{G}=G / V$. By minimality we have $\overline{F\left(C_{G}(R)\right)} \leq F(\bar{G})$. Now $F\left(C_{G}(R)\right) \nsubseteq$ $F(G)$, and so there exists a prime $q \neq p$ so that $\overline{O_{q}\left(C_{G}(R)\right)} \neq 1$. By the above, we obtain that $\overline{O_{q}\left(C_{G}(R)\right)} \leq O_{q}(\bar{G})$. Let $K$ denote the full inverse image of $O_{q}(\bar{G})$ in $G$. So $O_{q}\left(C_{G}(R)\right) \subseteq K \unlhd R F G$. Now $K$ is $R F$-invariant, hence $C_{K}(F)=1$. By Lemma 2.4, there exists a unique $R F$-invariant Sylow $q$-subgroup $Q$ of $K$. Thus $K=Q V$. However, $F(K)=V$, and so by minimality it follows that $G=K$.

Lemma 3.5. Let $1 \neq H \leq O_{q}\left(C_{G}(R)\right)$. Then $Q=\left\langle H^{F}\right\rangle$.

Proof. By Lemma 3.4, $G=Q V$ where $Q$ is an $R F$-invariant Sylow $q$-subgroup of $G$. By coprime action, we obtain that $O_{q}\left(C_{G}(R)\right) \leq Q$.

Set $Q_{0}=\left\langle H^{R F}\right\rangle$. Then $Q_{0}=\left\langle H^{F}\right\rangle$, since $H$ is centralised by $R$. Suppose $Q_{0}<Q$, and set $G_{0}=Q_{0} V$. Now $C_{G}(V)=V$, and so $O_{q}\left(G_{0}\right)=1$. By minimality, we obtain that
$F\left(C_{G_{0}}(R)\right) \leq F\left(G_{0}\right)=V$. However, $1 \neq H \subseteq F\left(C_{G_{0}}(R)\right)$. This contradiction forces $Q_{0} V=G_{0}=G=Q V$, and so $Q_{0}=Q$.

We may consider $V$ as an irreducible $\mathbb{F}_{p}[R F Q]$-module. We now extend the ground field to a splitting field $k$ for $R F Q$, and consider $W=V \otimes_{\mathbb{F}_{p}} k$. Henceforth, let $\bar{V}$ be an irreducible $k[R F Q]$-submodule of $W$.

Lemma 3.6. $Q$ acts faithfully on $\bar{V}$ and $C_{\bar{V}}(F)=0$.
Proof. Suppose $Q$ does not act faithfully on $\bar{V}$. Then there exists $1 \neq K \subseteq Q$ with $K \unlhd$ $R F Q$ so that $C_{\bar{V}}(K)=\bar{V}$. Now $C_{\bar{V}}(K) \subseteq C_{W}(K)=C_{V}(K) \otimes_{\mathbb{F}_{p}} k$, and so $C_{V}(K) \neq 0$. Since $K \unlhd R F Q$, it follows that $C_{V}(K)$ is normalised by $R F Q$. By the irreducibility of $V$, we have $C_{V}(K)=V$. However, $Q$ acts faithfully on $V$.

The second claim follows as $C_{W}(F)=C_{V}(F) \otimes_{\mathbb{F}_{p}} k=0$ and $C_{\bar{V}}(F) \subseteq C_{W}(F)$.
Lemma 3.7. $\left[C_{\bar{V}}(R), O_{q}\left(C_{G}(R)\right)\right]=0$.
Proof. Note that $C_{G}(R)=C_{V}(R) C_{Q}(R)$ where $C_{V}(R) \unlhd C_{G}(R)$. Thus

$$
\left[C_{V}(R), O_{q}\left(C_{G}(R)\right)\right]=C_{V}(R) \cap O_{q}\left(C_{G}(R)\right)=1
$$

By considering $C_{V}(R)$ as an $\mathbb{F}_{p}\left[O_{q}\left(C_{G}(R)\right)\right]$-module, we obtain that $\left[C_{W}(R)\right.$, $\left.O_{q}\left(C_{G}(R)\right)\right]=0$. Since $C_{\bar{V}}(R) \subseteq C_{W}(R)$, it follows that $\left[C_{\bar{V}}(R), O_{q}\left(C_{G}(R)\right)\right]=0$.

At this stage we note that we could invoke Proposition 1.5 to finish the proof of Theorem 1.2. As $O_{q}\left(C_{G}(R)\right) \subseteq C_{Q}(R)$, Proposition 1.5 together with Lemma 3.7 tells us that $O_{q}\left(C_{G}(R)\right)$ acts trivially on $\bar{V}$. However, since $Q$ is faithful on $\bar{V}$, we obtain that $O_{q}\left(C_{G}(R)\right)=1$. It follows that $F\left(C_{G}(R)\right) \subseteq F(G)$, which is a contradiction. We will now continue the proof of Theorem 1.2 without an appeal to Proposition 1.5.

Lemma 3.8. Suppose $\bar{V}$ is an imprimitive module for $R F Q$. Then $O_{q}\left(C_{G}(R)\right)$ centralises any block which is not normalised by $R$.

Proof. Let $\bar{V}=U_{0} \oplus \cdots \oplus U_{n}$ where the $U_{i}$ are blocks of imprimitivity in the action of $R F Q$ on $\bar{V}$, and set $\Omega=\left\{U_{0}, \ldots, U_{n}\right\}$. Let $R=\langle a\rangle$. We want to show that $O_{q}\left(C_{G}(R)\right)$ centralises

$$
U=\bigoplus_{U_{i} \in \operatorname{Mov}_{\Omega}(R)} U_{i}
$$

Clearly, $O_{q}\left(C_{G}(R)\right)$ acts on $\operatorname{Mov}_{\Omega}(R)$. Let $U_{i} \in \operatorname{Mov}_{\Omega}(R)$, and consider

$$
U^{\prime}=\bigoplus_{j=1}^{r} U_{i}^{a^{j}}
$$

Then for $u \in U_{i}, w=u+u^{a}+\cdots+u^{a^{r-1}}$ is centralised by $R$. Thus it is also centralised by $O_{q}\left(C_{G}(R)\right)$. Hence, $U^{\prime}$ is normalised by $O_{q}\left(C_{G}(R)\right)$. An $r$-cycle in $\operatorname{Sym}(r)$ is selfcentralising, so as $O_{q}\left(C_{G}(R)\right)$ is an $r^{\prime}$-group, it follows that $O_{q}\left(C_{G}(R)\right)$ normalises $U_{i}$. Since $w$ is centralised by $O_{q}\left(C_{G}(R)\right)$, and $O_{q}\left(C_{G}(R)\right)$ normalises $U_{i}$, it follows that $O_{q}\left(C_{G}(R)\right)$ must centralise $u$.

Henceforth, we will write $\bar{V}=V_{0} \oplus \cdots \oplus V_{n}$ where the $V_{i}$ are the homogeneous components with respect to $Z(Q)$. Set $\Gamma=\left\{V_{0}, \ldots, V_{n}\right\}$.

Our next major goal is to prove that $[Z(Q), Z(F)] \neq 1$. We thus proceed with the assumption that this is not the case and work to obtain a contradiction. We first need a few lemmas.

Lemma 3.9. Assume $[Z(Q), Z(F)]=1$. Then $R$ has only one fixed point on $\Gamma$.

Proof. Let $R=\langle a\rangle$. By Lemma 3.8, we obtain that $O_{q}\left(C_{G}(R)\right)$ centralises all of the subspaces $V_{i} \in \operatorname{Mov}_{\Gamma}(R)$. Now $C_{Q}(\bar{V})=1$ by Lemma 3.6, and so we have the strict inclusion $\operatorname{Mov}_{\Gamma}(R) \subset \Gamma$. Now $\operatorname{Fix}_{\Gamma}(R) \neq \emptyset$, hence $R$ is in the stabiliser of a point in the action of $R F Q$ on $\Gamma$, and is a Sylow $r$-subgroup of this stabiliser. Thus $N_{R F Q}(R)$ acts transitively on $\operatorname{Fix}_{\Gamma}(R)$. Now $N_{R F Q}(R)=R Z(F) C_{Q}(R)$. Clearly $R$ acts trivially on $\operatorname{Fix}_{\Gamma}(R)$. Also $\left[C_{Q}(R), Z(Q)\right]=1$, and by hypothesis we have $[Z(Q), Z(F)]=1$. Therefore, $Z(F) C_{Q}(R) \subseteq C_{R F Q}(Z(Q))$. Thus by Clifford's Theorem, $Z(F) C_{Q}(R)$ acts trivially on $\Gamma$. In particular, $Z(F) C_{Q}(R)$ acts trivially on $\operatorname{Fix}_{\Gamma}(R)$, and so $\left|\operatorname{Fix}_{\Gamma}(R)\right|=1$.

In the following lemma, let $Q_{i}=C_{Q}\left(V_{0} \oplus \cdots \oplus V_{i-1} \oplus V_{i+1} \oplus \cdots \oplus V_{n}\right)$.
Lemma 3.10. If $[Z(Q), Z(F)]=1$, then $Q=Q_{0} \times \cdots \times Q_{n}$.

Proof. We can assume without loss of generality that $\operatorname{Fix}_{\Gamma}(R)=\left\{V_{0}\right\}$. Since $R$ has no fixed points on $\Gamma-\left\{V_{0}\right\}$, it follows by Lemma 3.8 that $V_{1} \oplus \cdots \oplus V_{n}$ is centralised by $O_{q}\left(C_{G}(R)\right)$. Thus $O_{q}\left(C_{G}(R)\right) \subseteq Q_{0}$. The result now follows from Lemma 2.7 with $Q$ and $\bar{V}$ in place of $G$ and $V$ respectively.

Let $F_{0}=N_{F}\left(V_{0}\right)$. Then $F_{0} \neq 1$ otherwise $V_{0}$ would be in a regular orbit under the action of $F$ on $\Gamma$. Thus $\left\langle V_{0}^{F}\right\rangle$ would be a free $F$-module and so $C_{\bar{V}}(F) \neq 1$ contrary to Lemma 3.6.

Lemma 3.11. If $[Z(Q), Z(F)]=1$, then $Q_{0}=\left\langle O_{q}\left(C_{G}(R)\right)^{F_{0}}\right\rangle$.
Proof. Let $f \in F$ and suppose $V_{0}^{f}=V_{i}$. Let $g \in O_{q}\left(C_{G}(R)\right)$ and $v \in V_{j} \neq V_{i}$. Then $v^{f^{-1}} \in V_{k} \neq V_{0}$, and so $\left[v^{f^{-1}}, g\right]=1$. Hence $v^{g^{f}}=v$. Therefore, $g^{f} \in Q_{i}$, and so $O_{q}\left(C_{G}(R)\right)^{f} \subseteq Q_{0}$ if and only if $f \in F_{0}$.

Now $Q /\left(Q_{1} \times \cdots \times Q_{n}\right) \cong Q_{0}$ and $\left\langle O_{q}\left(C_{G}(R)\right)^{F-F_{0}}\right\rangle \subseteq Q_{1} \times \cdots \times Q_{n}$. So if we consider the canonical epimorphism $\phi: Q \longrightarrow Q /\left(Q_{1} \times \cdots \times Q_{n}\right)$, it follows that $\left\langle O_{q}\left(C_{G}(R)\right)^{F_{0}}\right\rangle$ maps onto $Q /\left(Q_{1} \times \cdots \times Q_{n}\right)$ under $\phi$. So

$$
Q=\left\langle O_{q}\left(C_{G}(R)\right)^{F_{0}}\right\rangle \times Q_{1} \times \cdots \times Q_{n}
$$

By considering orders it follows that $\left|Q_{0}\right|=\left|\left\langle O_{q}\left(C_{G}(R)\right)^{F_{0}}\right\rangle\right|$. Hence $Q_{0}=$ $\left\langle O_{q}\left(C_{G}(R)\right)^{F_{0}}\right\rangle$.

Lemma 3.12. If $[Z(Q), Z(F)]=1$, then $C_{Q_{0}}\left(F_{0}\right)=1$.
Proof. By noting that $C_{Q}(F)=1$, this follows by Lemma 2.8 with $F$ and $Q$ in place of $G$ and $H$ respectively.

Lemma 3.13. $[Z(Q), Z(F)] \neq 1$.
Proof. Assume that this is not the case so $[Z(Q), Z(F)]=1$. Then $Q \cong Q_{0} \times \cdots \times Q_{n}$ where the $Q_{i}$ are defined as in Lemma 3.10, and $C_{Q_{0}}\left(F_{0}\right)=1$ by Lemma 3.12.

Now since the $V_{i}$ are homogeneous components for $Z(Q)$, and $k$ is a splitting field for $Z(Q), Z(Q)$ acts on $V_{0}$ by scalars. However, $Z(Q)=Z\left(Q_{0}\right) \times \cdots \times Z\left(Q_{n}\right)$, and $Z\left(Q_{1}\right) \times \cdots \times Z\left(Q_{n}\right)$ acts trivially on $V_{0}$. So $Z\left(Q_{0}\right)$ acts on $V_{0}$ nontrivially by scalars, otherwise $C_{Q}(\bar{V}) \neq 1$ as $Z\left(Q_{0}\right) \neq 1$. This follows since $1 \neq O_{q}\left(C_{G}(R)\right) \subseteq Q_{0}$. We know that $Z\left(Q_{0}\right)$ acts by scalars on $V_{0}$, and so every element in $\left[F_{0}, Z\left(Q_{0}\right)\right]$ acts trivially on $V_{0}$. However, since $Q_{0}$ acts faithfully on $V_{0}$, and $\left[F_{0}, Z\left(Q_{0}\right)\right] \subseteq Z\left(Q_{0}\right)$, it follows that $F_{0}$ must centralise $Z\left(Q_{0}\right)$, and thus $1 \neq C_{Q_{0}}\left(F_{0}\right)$. This is a contradiction to Lemma 3.12.

Corollary 3.14. $Z(F)$ acts semiregularly on $\Gamma$.

Proof. Suppose $Z(F)$ normalises some $V_{j} \in \Gamma$. Since $R F$ is transitive on $\Gamma$, and $Z(F)=$ $Z(R F)$, we find that $Z(F)$ acts trivially on $\Gamma$. Now $Z(Q)$ acts on each $V_{i} \in \Gamma$ by scalars, and so $[Z(F), Z(Q)]$ must act trivially on each $V_{i} \in \Gamma$. This forces $[Z(F), Z(Q)]=1$ since $C_{Q}(\bar{V})=1$, which is a contradiction to Lemma 3.13.

Lemma 3.15. $Q$ acts trivially on any system of imprimitivity in the action of $R F Q$ on $\bar{V}$.
Proof. Let $\bar{V}=U_{0} \oplus \cdots \oplus U_{n}$ where the $U_{i}$ are blocks of imprimitivity in the action of $R F Q$ on $\bar{V}$, and set $\Omega=\left\{U_{0}, \ldots, U_{n}\right\}$. We work to show that $O_{q}\left(C_{G}(R)\right)$ acts trivially on $\Omega$. Then the normal closure of $O_{q}\left(C_{G}(R)\right)$ in $R F Q$ will also act trivially on $\Omega$. Since $\left\langle O_{q}\left(C_{G}(R)\right)^{R F Q}\right\rangle=Q$, the claim will follow.

Let $R=\langle a\rangle$. Then $O_{q}\left(C_{G}(R)\right)$ centralises any $U_{i} \in \operatorname{Mov}_{\Omega}(R)$ by Lemma 3.8. Also, as in the proof of Lemma 3.9, we get that $\operatorname{Fix}_{\Omega}(R) \neq \emptyset$ and $N_{R F Q}(R)$ is transitive on $\operatorname{Fix}_{\Omega}(R)$. Now $N_{R F Q}(R)=R Z(F) C_{Q}(R)$. Clearly, $R$ acts trivially on $\operatorname{Fix}_{\Omega}(R)$. Let $U_{j} \in \operatorname{Fix}_{\Omega}(R)$, and suppose $Z(F) \nsubseteq N_{F}\left(U_{j}\right)$. Then $N_{F}\left(U_{j}\right) \cap Z(F)=1$ since
$Z(F)$ is cyclic of prime order. In particular, $R$ acts semiregularly on $N_{F}\left(U_{j}\right)$ because $C_{F}(R)=Z(F)$. Note that $N_{F}\left(U_{j}\right) \neq 1$, otherwise $F$ would have a regular orbit on $\Omega$ and thus a nontrivial fixed point on $\bar{V}$, contrary to Lemma 3.6. Therefore, $N_{F}\left(U_{j}\right)$ must be elementary abelian since it is isomorphic to its image under the canonical epimorphism $\varphi: F \longrightarrow F / Z(F)$. Also $C_{U_{j}}\left(N_{F}\left(U_{j}\right)\right)=0$ by Lemma 2.8. Hence $C_{U_{j}}(R) \neq 0$ by Lemma 2.9. Thus by Lemma 3.7, $O_{q}\left(C_{G}(R)\right)$ normalises $U_{j}$.

Suppose that $O_{q}\left(C_{G}(R)\right)$ does not normalise $U_{j} \in \operatorname{Fix}_{\Omega}(R)$. Then reasoning as above we must have $Z(F) \subseteq N_{F}\left(U_{j}\right)$ and $C_{U_{j}}(R)=0$. Thus $C_{Q}(R)$ can only map $U_{j}$ to a subspace $U_{i} \in \operatorname{Fix}_{\Omega}(R)$ which itself is normalised by $Z(F)$. So $Z(F)$ must act trivially on $\mathrm{Fix}_{\Omega}(R)$, otherwise we get two distinct orbits in the action of $N_{R F Q}(R)$ on $\mathrm{Fix}_{\Omega}(R)$. Since $Z(F)$ is trivial on $\operatorname{Fix}_{\Omega}(R)$, we obtain that $Z=\left[O_{q}\left(C_{G}(R)\right), Z(F)\right]$ is also trivial on $\operatorname{Fix}_{\Omega}(R)$. Also, $Z$ centralises each subspace $U_{j} \in \operatorname{Mov}_{\Omega}(R)$ since $Z \subseteq O_{q}\left(C_{G}(R)\right)$, and so $Z$ acts trivially on $\Omega$. Note that $Z \neq 1$, since $[Z(Q), Z(F)] \neq 1$, and so by Lemma 3.5 we have $Q=\left\langle Z^{F}\right\rangle$. Thus it follows that $Q$ also acts trivially on $\Omega$. This is a contradiction since $U_{j}$ is not normalised by $O_{q}\left(C_{G}(R)\right)$.

Corollary 3.16. Every characteristic abelian subgroup of $Q$ is contained in $Z(Q)$.
Proof. Let $A$ be a characteristic abelian subgroup of $Q$. Let $\bar{V}=U_{0} \oplus \cdots \oplus U_{n}$ where the $U_{i}$ are homogeneous components with respect to $A$. Then $\Omega=\left\{U_{0}, \ldots, U_{n}\right\}$ is a system of imprimitivity for $R F Q$ on $\bar{V}$, and so $Q$ is trivial on $\Omega$. Since $A$ acts by scalars on any given $U_{i} \in \Omega,[Q, A]$ centralises $\bar{V}$. This forces $[Q, A]=1$, and thus $A \subseteq Z(Q)$.

Corollary 3.17. $Q$ has nilpotence class at most two.

Proof. Since every characteristic abelian subgroup of $Q$ is contained in $Z(Q)$, it follows that $Z(\Phi(Q)) \subseteq Z(Q)$. Thus $\Phi(Q) \subseteq Z(Q)$ by Lemma 2.1, and so $Q / Z(Q)$ is abelian.

Recall that $\Gamma$ is the set of $Z(Q)$-homogeneous components in $\bar{V}$. We know that the subset of components in $\Gamma$ which are normalised by $R$ is nonempty, and that $N_{R F}(R)=$ $R \times Z(F)$ acts transitively on this set. We also know, since $Z(F) \unlhd R F$, that the orbits of the action of $Z(F)$ on $\Gamma$ forms a system of imprimitivity $\bar{V}=W_{0} \oplus \cdots \oplus W_{m}$ for the action of $R F$ on $\Gamma$. We can assume without loss of generality that $V_{0}$ is normalised by $R$ and that $W_{0}$ is the direct sum of components in the orbit of $V_{0}$ under the action of $Z(F)$ on $\Gamma$. Henceforth, we set $Q_{i}=C_{\bar{V}}\left(W_{0} \oplus \cdots \oplus W_{i-1} \oplus W_{i+1} \oplus \cdots \oplus W_{m}\right)$, and find that $Q=Q_{0} \times \cdots \times Q_{m}$, which follows exactly as in Lemma 3.10.

Lemma 3.18. $Q_{0}=\left\langle O_{q}\left(C_{G}(R)\right)^{N_{F}\left(V_{0}\right)}\right\rangle$.
Proof. We first show that $N_{F}\left(W_{0}\right)=Z(F) \times N_{F}\left(V_{0}\right)$. We can assume without loss of generality that $W_{0}=V_{0} \oplus \cdots \oplus V_{s-1}$. Set $\Delta=\left\{V_{0}, \ldots, V_{s-1}\right\}$. By definition $Z(F) \subseteq N_{F}\left(W_{0}\right)$ and is transitive on $\Delta$. In particular, since $|\Delta|=s, N_{F}\left(W_{0}\right)$ is primitive on $\Delta$. Since $N_{F}\left(W_{0}\right)$ is an $s$-group and $|\Delta|=s, N_{F}\left(V_{0}\right)$ must be the full kernel
in the action of $N_{F}\left(W_{0}\right)$ on $\Delta$. We find that $N_{F}\left(W_{0}\right) / N_{F}\left(V_{0}\right)$ is regular on $\Delta$, and so $N_{F}\left(W_{0}\right) / N_{F}\left(V_{0}\right) \cong \mathbb{Z}_{s}$. Thus it follows that $N_{F}\left(W_{0}\right)=Z(F) \times N_{F}\left(V_{0}\right)$. Arguing exactly as in the proof of Lemma 3.11, we find that $Q_{0}=\left\langle O_{q}\left(C_{G}(R)\right)^{N_{F}\left(W_{0}\right)}\right\rangle$. Now $[R, Z(F)]=1$, and so $O_{q}\left(C_{G}(R)\right)^{Z(F)}=O_{q}\left(C_{G}(R)\right)$. Thus

$$
Q_{0}=\left\langle O_{q}\left(C_{G}(R)\right)^{Z(F) \times N_{F}\left(V_{0}\right)}\right\rangle=\left\langle O_{q}\left(C_{G}(R)\right)^{N_{F}\left(V_{0}\right)}\right\rangle
$$

Lemma 3.19. $\left[Z\left(Q_{0}\right), R\right]=1$.
Proof. Since the subspaces $V_{i} \subseteq \bar{V}$ are homogeneous components for $Z(Q), Z\left(Q_{0}\right)$ acts on them by scalars. Now $W_{0}$ is the direct sum of components which are normalised by $R$. Since $Z\left(Q_{0}\right)$ acts by scalars on any given $V_{i} \subseteq W_{0}$, it follows that $\left[Z\left(Q_{0}\right), R\right]$ acts trivially on $W_{0}$. However, $Q$ is faithful on $\bar{V}$, and since $Q_{0}$ centralises $W_{1} \oplus \cdots \oplus W_{m}$, this forces $\left[Z\left(Q_{0}\right), R\right]=1$.

Lemma 3.20. $Q$ is abelian.

Proof. Note that $Q^{\prime} \cap O_{q}\left(C_{G}(R)\right)=1$. Hence

$$
\left[O_{q}\left(C_{G}(R)\right), C_{Q}(R)\right] \subseteq Q^{\prime} \cap O_{q}\left(C_{G}(R)\right)=1
$$

and so $O_{q}\left(C_{G}(R)\right) \subseteq Z\left(C_{Q}(R)\right)$. By Lemma 3.19, we have $\left[Z\left(Q_{0}\right), R\right]=1$, and so since $Q$ has nilpotence class at most two, $Q_{0}=\left[Q_{0}, R\right] * C_{Q_{0}}(R)$. However, since $O_{q}\left(C_{G}(R)\right) \subseteq$ $Z\left(C_{Q}(R)\right)$, it follows that $O_{q}\left(C_{G}(R)\right) \subseteq Z\left(C_{Q_{0}}(R)\right)$, and so $O_{q}\left(C_{G}(R)\right) \subseteq Z\left(Q_{0}\right) \subseteq$ $Z(Q)$. Set $G_{0}=Z(Q) V$. If $G_{0}<G$, then $F\left(C_{G_{0}}(R)\right) \subseteq F\left(G_{0}\right)=V$ by induction. However, since $O_{q}\left(C_{G}(R)\right) \subseteq Z(Q)$, there are clearly $q$-elements in $F\left(C_{G_{0}}(R)\right)$. Thus $G_{0}=G$, and so $Z(Q)=Q$.

We now complete the proof of Theorem 3.1.
It follows from Corollary 3.14 that $Z(F) \nsubseteq N_{F}\left(V_{i}\right)$ for any $V_{i} \in \Gamma$. Thus $Z(F) \cap$ $N_{F}\left(V_{0}\right)=1$ since $Z(F)$ is cyclic of prime order. Hence $N_{F}\left(V_{0}\right)=\left[R, N_{F}\left(V_{0}\right)\right]$. Since $Q$ is abelian, Lemma 3.19 now says that $\left[Q_{0}, R\right]=1$, and so $\left[Q_{0}, N_{F}\left(V_{0}\right)\right]=1$. Thus $Q_{0}=\left\langle O_{q}\left(C_{G}(R)\right)^{N_{F}\left(V_{0}\right)}\right\rangle=O_{q}\left(C_{G}(R)\right)$. Now $N_{F}\left(V_{0}\right)$ is abelian, and $C_{V_{0}}\left(N_{F}\left(V_{0}\right)\right)=0$ by Lemma 2.8. Hence $C_{V_{0}}(R) \neq 0$ by Lemma 2.9. Since $\left[O_{q}\left(C_{G}(R)\right), C_{V}(R)\right]=1$, we must have that $Q_{0}$ acts trivially on $C_{V_{0}}(R)$. However, $V_{0}$ is a homogeneous component for $Q_{0}$, and so $Q_{0}$ must act trivially on $V_{0}$. It follows that $Q_{0}$ acts trivially on $W_{0}$ and thus $Q_{0}$ acts trivially on $\bar{V}$. However, this is a contradiction since $C_{Q}(\bar{V})=1$.

Corollary 3.21. Let $R \cong \mathbb{Z}_{r}$ for some prime $r$ and $F$ be an extraspecial s-group. Suppose that $R$ acts on $F$ in such a way that $[R, Z(F)]=1$ and $R F / Z(F)$ is a Frobenius group. Suppose further that RF acts on a group $G$ so that $C_{G}(F)=1$ and $(r,|G|)=1$. Then $F_{i}\left(C_{G}(R)\right)=F_{i}(G) \cap C_{G}(R)$ for all $i$.

Proof. Let $i \in \mathbb{N}$ be the least such that $F_{i}\left(C_{G}(R)\right) \nsubseteq F_{i}(G)$. We know that $F\left(C_{G}(R)\right) \leq$ $F(G)$ by Theorem 3.1, and so $i>1$. Let $\bar{G}=G / F_{i-1}(G)$, and $\phi$ be the canonical epimorphism from $G$ onto $\bar{G}$. Now $\overline{F_{i}\left(C_{G}(R)\right)} \unlhd \overline{C_{G}(R)}$ and $\overline{F_{i}\left(C_{G}(R)\right)}$ is nilpotent since $F_{i-1}\left(C_{G}(R)\right) \subseteq \operatorname{ker}(\phi)$. Now

$$
\overline{F_{i}\left(C_{G}(R)\right)} \leq F\left(\overline{C_{G}(R)}\right)=F\left(C_{\bar{G}}(R)\right) \leq F(\bar{G})
$$

By the definition of $F_{i}(G)$, we have $F(\bar{G})=\overline{F_{i}(G)}$. Therefore, $\overline{F_{i}\left(C_{G}(R)\right)} \subseteq \overline{F_{i}(G)}$. However, this is a contradiction since $F_{i}\left(C_{G}(R)\right) \nsubseteq F_{i}(G)$.

Corollary 3.22. Let $R \cong \mathbb{Z}_{r}$ for some non-Fermat prime $r$ and $F$ be an extraspecial s-group. Suppose that $R$ acts on $F$ in such a way that $[R, Z(F)]=1$ and $R F / Z(F)$ is a Frobenius group. Suppose further that $R F$ acts on a group $G$ so that $C_{G}(F)=1$ and $(r,|G|)=1$. Then $f\left(C_{G}(R)\right)=f(G)$.

Proof. Let $n \in \mathbb{N}$ be the Fitting height of $C_{G}(R)$. Now we know that $F_{n}\left(C_{G}(R)\right)=$ $F_{n}(G) \cap C_{G}(R)$, and so $C_{G}(R) \leq F_{n}(G)$. We work to show that $F_{n}(G)=G$. Suppose this is not the case, so $F_{n}(G)<G$. Let $S$ be an $R F$-invariant section of $G / F_{n}(G)$ which has no proper $R F$-invariant subgroups. By coprime action, $R$ acts fixed point freely on $G / F_{n}(G)$. Also, $F$ acts nontrivially on $S$ since $C_{G / F_{n}(G)}(F)=1$. By Theorem 2.10, it follows that either $\left[R, F / C_{F}(S)\right]=1$ or $r$ is a Fermat prime. By hypothesis, the former must hold. Since $C_{F}(R)=\Phi(F)$, we obtain that $F=C_{F}(S) \Phi(F)$. However, this implies $F=C_{F}(S)$, which is a contradiction.

Note that if $G$ is a minimal counterexample to Corollary 3.22, we obtain that $f(G) \leq$ $f\left(C_{G}(R)\right)+1$ in any case, since $G / F_{n}(G)$ admits a fixed-point-free automorphism of prime order.

Corollaries 3.21 and 3.22 together with Theorem 1.1 confirm Corollaries 1.3 and 1.4 stated in the introduction. Note that we cannot drop the condition that $r$ be a nonFermat prime in Corollary 3.22. In particular, if $R \cong \mathbb{Z}_{r}$ where $r$ is a prime of the form $r=2^{n}+1$, then there exists an extraspecial group $F$ on which $R$ acts such that $F=[F, R]$, and a group $G$ on which $R F$ acts such that $C_{G}(F)=1, f(G)=1$ and $f\left(C_{G}(R)\right)=0$.

## Acknowledgments

This work forms part of the PhD thesis of the first author who was supported by an EPSRC doctoral training grant. The authors would also like to thank the referee for his thorough reading of this manuscript and his numerous suggestions for improvement.
