

Millimetre Wave Inter-Satellite Links

Oliver Kirkpatrick (RMIT University), Dush Thalakatuna (UTS)

This work has been supported by the SmartSat CRC, whose activities are funded by the Australian Government's CRC Program.

Project Partners

MACQUARIE
University

Motivation

- Satellite communications industry is now driven by high-performance, low-cost small (sometimes fractionated) satellite systems in LEO constellations
- LEO satellites do not have constant contact with ground stations.
- Accurate pointing and tracking
- Restrictive size, weight, and power requirements
- Simultaneous connectivity with multiple satellites

Satellite constellation

Satellite formation flying

Why Millimetre Wave ISL?

ITU Spectrum Allocation for ISL

57,000.00	58,200.00	1,200.00	EARTH-EXPL-SAT (passive),INTER-SAT,SPACE RESEARCH(passive)
59,000.00	59,300.00	300	EARTH-EXPL-SAT (passive),INTER-SAT,SPACE RESEARCH(passive)
59,300.00	64,000.00	4,700.00	INTER-SAT
64,000.00	65,000.00	1,000.00	INTER-SAT,RADIO ASTRONOMY
65,000.00	66,000.00	1,000.00	EARTH-EXPL-SAT,INTER-SAT,SPACE RESEARCH

- Beams are electronically steerable
- Small size (due to wavelength) and weight
- Multiple beams possible
- Allows for beam tracking
- Scalable and versatile
- Fails gracefully
- Space to space + atmospheric attenuation separates ground communication and ISL

Project Focus

LEO Satellites (Hawkeye Formation)

MEO/GEO Satellites
(Hawkeye Chief to Optus 10)

Market Needs

- High Data rate links
- Low size and weight
- Security
- Adhere to regulations around interference systems (spectrum coordination)

Hawkeye Case Study

- Beam steering required to both deputies
- Azimuth range to Hawk-2A varies over long time periods, but generally between +/-5 and +/- 8 degrees

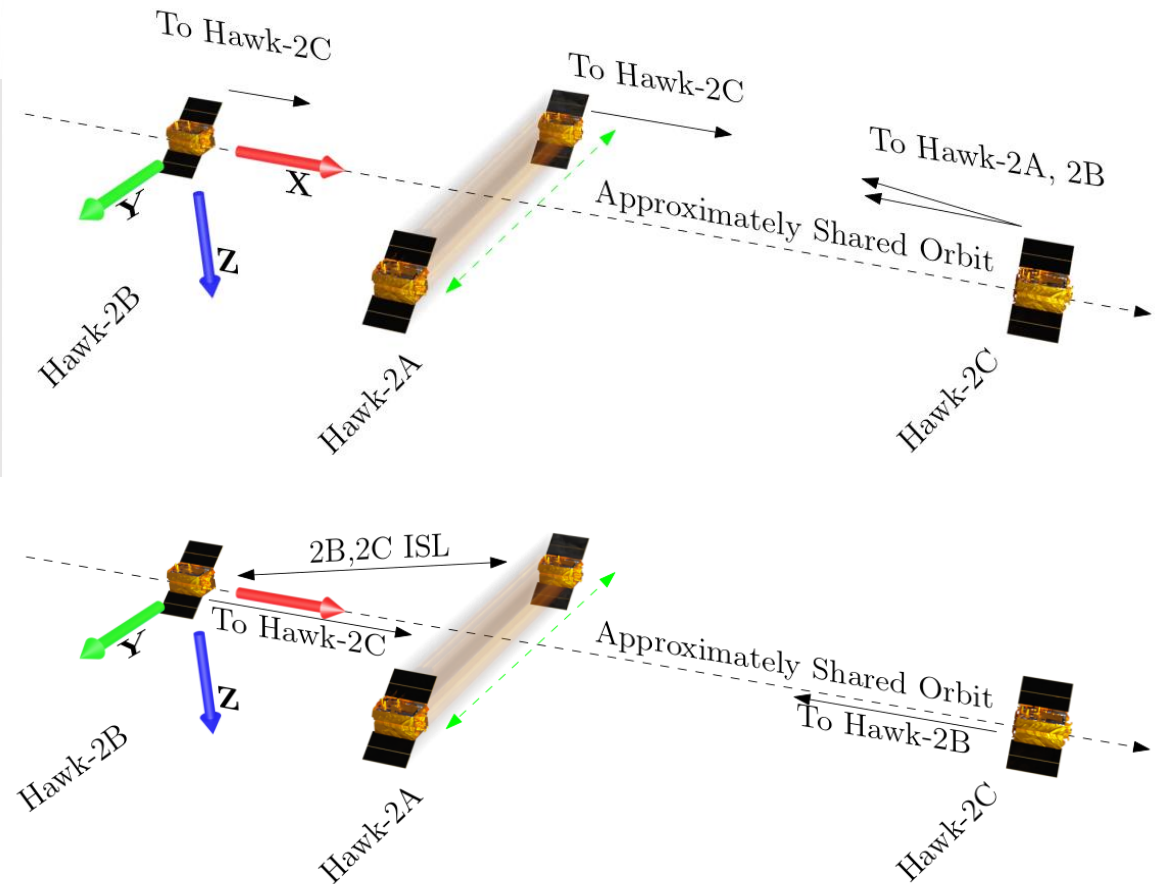

Antenna Mounting

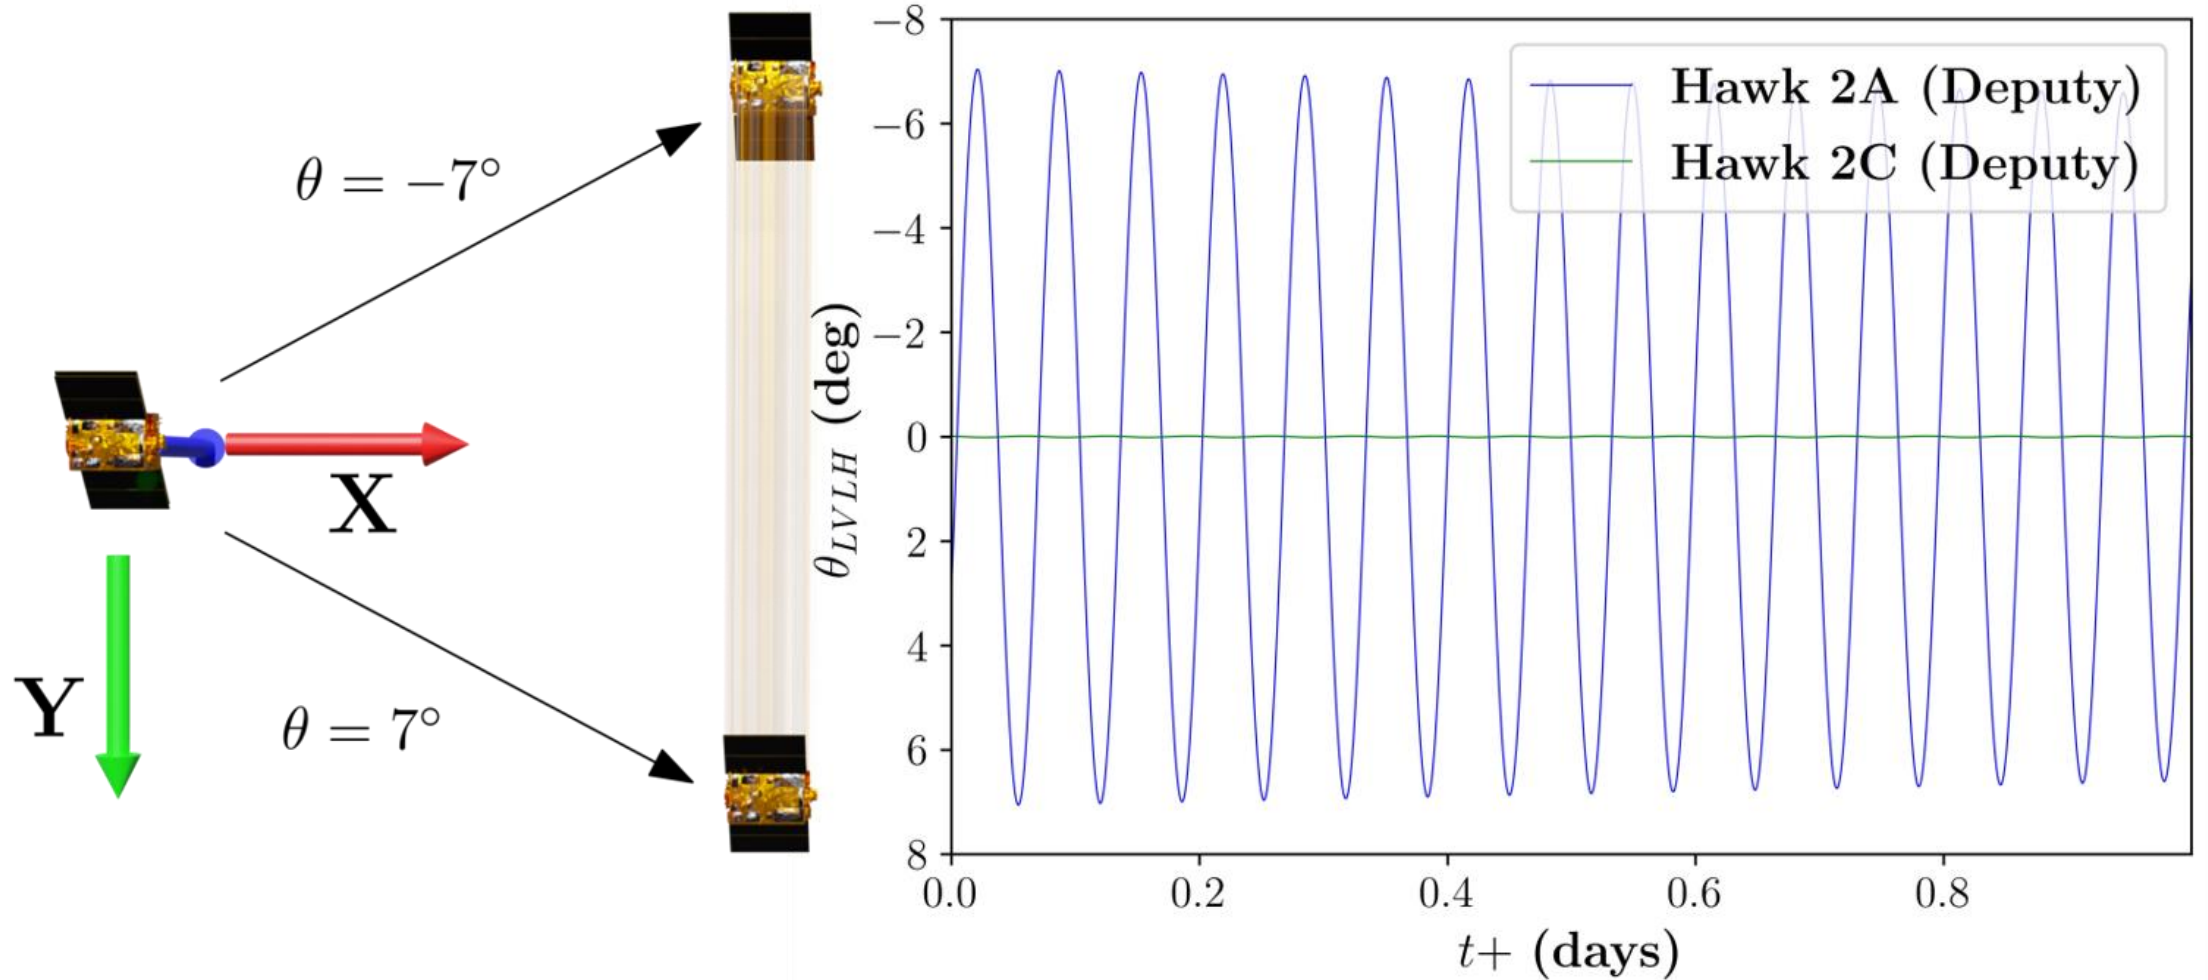

Dual Antenna, Single Beam, Hawk-2A

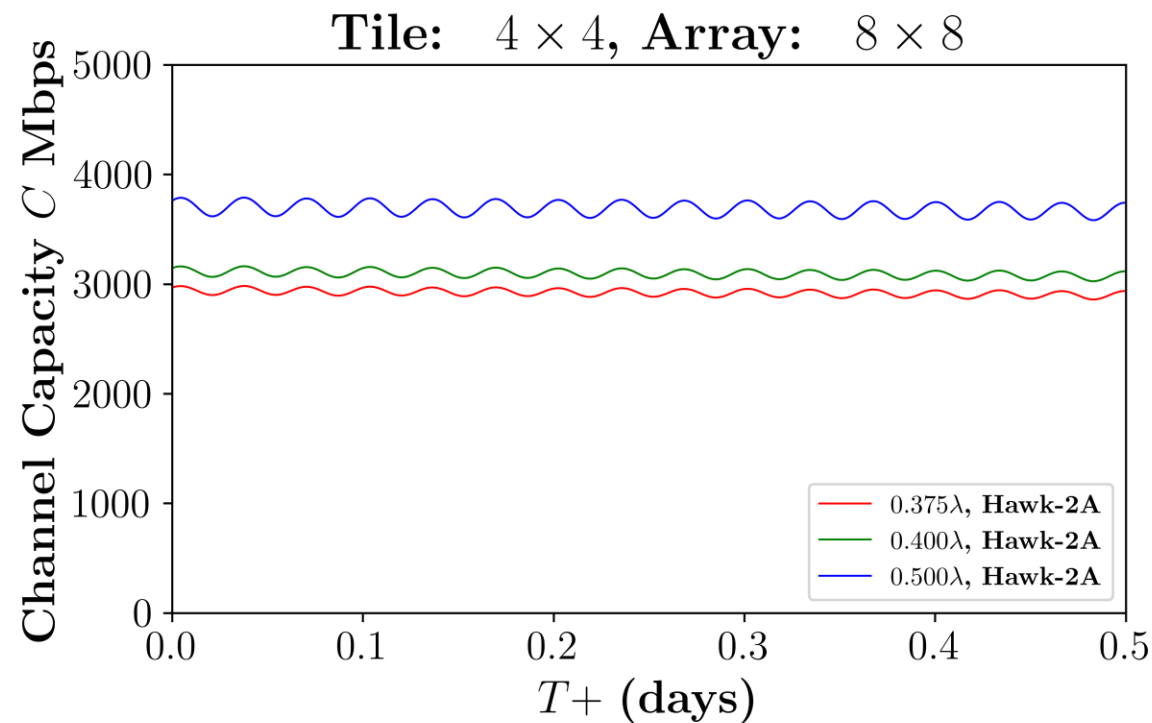

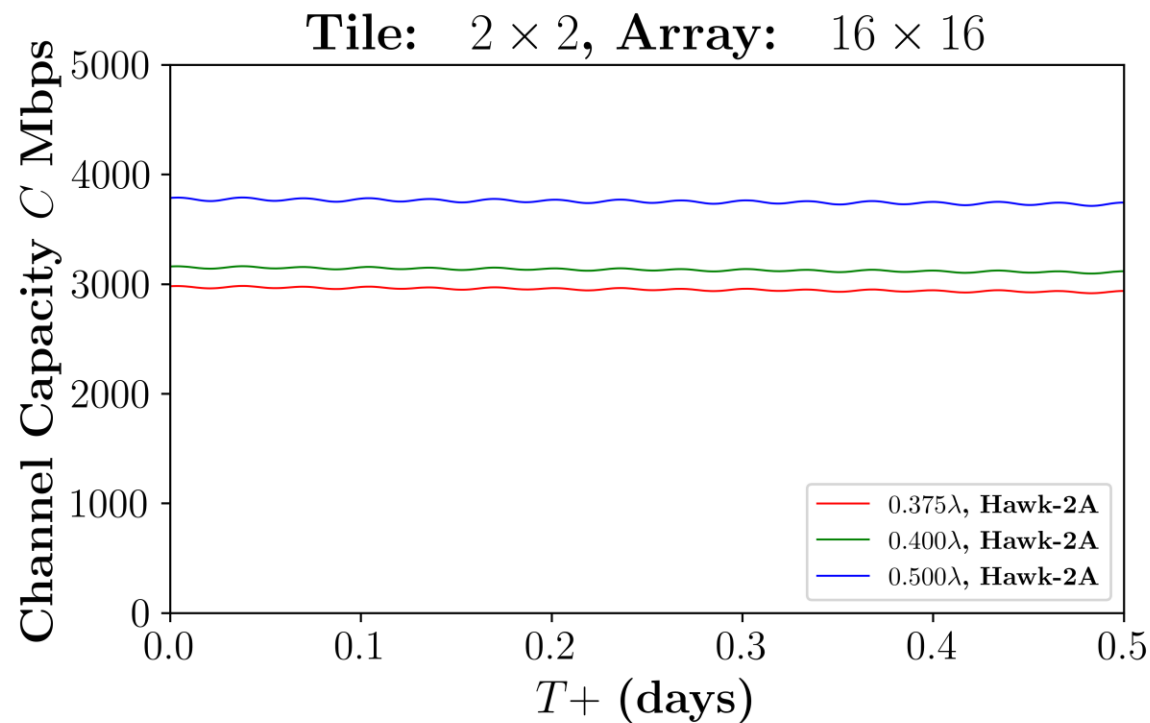

Dual Beam, Single Antenna, Hawk-2C

Implications on Tracking and Beamforming

Implications on Channel Capacity

B MHz	P_t W	G_t	G_r	λ	T	\mathcal{L}_0	d
500	25	$F(t)$	$F(t)$	≈ 5 mm	700 k	3 dB	$F(t)$

Q&A
