#### Abstract

We extend Abadi-Fournet's applied pi calculus with state cells, which are used to reason about protocols that store persistent information. Examples are protocols involving databases or hardware modules with internal state. We distinguish between private state cells, which are not available to the attacker, and public state cells, which arise when a private state cell is compromised by the attacker. For processes involving only private state cells we define observational equivalence and labelled bisimilarity in the same way as in the original applied pi calculus, and show that they coincide. Our result implies Abadi-Fournet's theorem - the coincidence of observational equivalence and labelled bisimilarity - in a revised version of the applied pi calculus. For processes involving public state cells, we can essentially keep the definition of observational equivalence, but need to strengthen the definition of labelled bisimulation in order to show that observational equivalence and labelled bisimilarity coincide in this case as well.

## 1. Introduction

Security protocols are small distributed programs that use cryptography in order to achieve multiple security goals like confidentiality, authentication. The complexity that arises from their distributed nature motivates formal analysis in order to prove logical properties of their behaviour; fortunately, they are often small enough to make this kind of analysis feasible. Various logical methods have been used to model security protocols; process calculi have been particularly successful [3, 5, 34]. For example, the TLS protocol used by billions of users every day was analysed using ProVerif [12].

More recently, protocol analysis methods have been applied to stateful protocols - that is, protocols which involve persistent state information that can affect and be changed by protocol runs. Hardware devices that have some internal memory can be described by such protocols. For example, Yubikey is a USB device which generates one-time passwords based on encryptions of a secret ID, a running counter and some random values using a unique AES-128 key contained in the device. The trusted

[^0]platform module (TPM) is another hardware chip that has a variety of registers which represent its state, and protocols for updating them. Radio-frequency identification (RFID) is a wireless technology for automatic identification and is currently deployed in electronic passports, tags for consumer goods, livestock and pets tracking, etc. An RFID-tag has a small area for storing secrets, which may be modified.

A process calculus can be made to work with such stateful protocols either by extension or by encoding. Extension means adding to the calculus explicit constructs for working with the stateful aspects, while encoding means using combinations of the primitives that already exist. Encodings have the advantage that they keep the calculus simple and elegant, but (as argued in [3]) there may not be encodings for all the aspects we want, and in cases that encodings exist they may not be suitable for the analysis of security properties.

In this paper we choose to extend the applied pi calculus rather than use the encoding for two reasons. Firstly, state and channels are conceptually different: states store information whereas channels are used for communication. There is also a wellestablished way of adding state to programming languages which will apply to add state to the applied pi calculus. Secondly, automated protocol verification tools based on the applied pi calculus like ProVerif often fail to prove security properties when using the encoding via restricted channels. ProVerif also provides some built-in features, such as tables and phases, which provide only limited ways for modelling states. In particular, tables are defined as predicates which allow processes to store data by extending a predicate for the data. Hence there is no notion of the "current" state, and values cannot be deleted from tables. Phases are used to model the protocols with several stages. But there can be only finitely many phases, which can only be run in sequence, whereas a state may have infinitely many arbitrary values. StatVerif [8] extends ProVerif with explicit states, thereby implementing the extension of the applied pi calculus presented in this paper. It has been successfully used in cases where ProVerif fails.

Our Contributions. We present an extension of the applied pi calculus by adding state cells, which are used to reason about protocols that store persistent information. We distinguish between private state cells, which are not available to the attacker, and public state cells, which arise when a private state cell is compromised by the attacker. In our stateful language, a private state cell is guarded by the scope restriction; its access is limited to some designated processes. When a private state cell gets compromised, the cell becomes public and this scenario is modelled by removing the scope restriction of that cell. We first define observational equivalence and labelled bisimilarity for processes having only private state cells, and we prove that two notions coincide as expected. By encoding the private state cells with restricted channels while keeping observational equivalence, our coincidence result can be seen to imply AbadiFournet's theorem [3, Theorem 1], in a revised version of applied pi calculus. As far as we can see, the only available proof for this theorem is [31] which is an unpublished manuscript. Despite having no published proof, this theorem has been widely used in many publications, for example [21, 9, 4, 20, 22].

We also discuss an extension of our language with public state cells. The obvious notion of labelled bisimilarity does not capture observational equivalence on public state cells. Designing a labelled bisimilarity on public state cells turns out to be un-
expectedly difficult. Public state cells introduce many special language features which are significantly different from private state cells. Moreover, the addition of public state cells increases the capabilities of the attacker significantly. Hence we strengthen the definition of labelled bisimilarity to show that observational equivalence and labelled bisimulation coincide.

As an illustration, we analyse the OSK protocol [28] for RFID tags. We model its untraceability by private state cells and model its forward privacy by public state cells.

This paper is an extension of the conference version [7] with the complete proofs.
Related Work. StatVerif [8] is an extension of ProVerif process language [14] with private state cells. The main contribution there is to extend the ProVerif compiler to a compiler for StatVerif. So far, StatVerif can only handle secrecy properties, which are modelled as reachability properties of traces. SAPIC [29] is a similar tool as StatVerif except that SAPIC is based on Tamarin verifier [36] rather than ProVerif. Both StatVerif and SAPIC are the compilers which translate a stateful language into a low-level language that is directly supported by a tool, i.e., horn-clauses supported by ProVerif, multiset rewriting rules (in which antecedents of applied rules are withdrawn from the knowledge set in order to represent state changes) supported by Tamarin. However, none of the existing works study the language feature of the stateful language and the notions of process equivalences are never defined for a stateful language. Process equivalences are important concepts which can be used to model the indistinguishability properties in security protocols [5, 3].

This paper describes the process calculus on which StatVerif is based. More precisely, the focus in this paper is to build a stateful language based on applied pi calculus, explore its language features and discuss indistinguishability, which is modelled by observational equivalence and analysed by labelled bisimilarity. This paper provides therefore the basis to extend StatVerif to handle bisimilarity.

There are other languages that have been used to model protocols involving persistent state, but they are lower-level languages that are further away than our process language from the protocol design. Strand spaces have been generalised to work with the global state required by a trusted party charged with enforcing fair exchange [27].

Tamarin has been used to analyse stateful protocols directly without going through the stateful language of SAPIC, e.g. for the analysis of hardware password tokens [30]. Multi-set rewriting is also used in [33], where state changes are important to represent revocation of cryptographic keys. Horn clauses rather than multiset rewriting are used in [24], in order to represent state changes made to registers of the TPM hardware module.

Reasoning about programming languages involving states has been extensively studied (e.g. [37, 25]). There are very strong interactions between programming language features and state, hence the reasoning principles are very specific to the precise combination of features. In this work we build on the work on reasoning principles for process calculi using bisimulation and show how to extend these principles to handle global state.

Outline. The next section defines syntax and semantics for the stateful applied pi calculus. Section 3 discusses the process equivalences and encoding for private state
cells, and derives Abadi-Fournet's theorem. Section 6 extends our stateful language with public state cells. The paper concludes in Section 7 .

## 2. Stateful Applied Pi Calculus

In this section, we extend the applied pi calculus [3] with constructs for states, and define its operational semantics. In fact, we do not directly build the stateful language on top of applied pi calculus, because we want to avoid working with the structural equivalence relation. More precisely, reasoning about the equivalent classes induced by structural equivalence turns out to be difficult and normally results in long tedious proofs [23, 20, 32, 19]. Our language inherits constructs for scope restriction, communication and active substitutions from applied pi calculus while having multisets of processes and active substitutions makes it possible to specify an operational semantics which does not involve any structural equivalence.

### 2.1. Syntax

We assume two disjoint, infinite sets $\mathcal{N}$ and $\mathcal{V}$ of names and variables, respectively. We rely on a sort system including a universal base sort, a cell sort and a channel sort. The sort system splits $\mathcal{N}$ into channel names $\mathcal{N}_{c h}$, base names $\mathcal{N}_{b}$ and cell names $\mathcal{N}_{s}$; similarly, $\mathcal{V}$ is split into channel variables $\mathcal{V}_{c h}$ and base variables $\mathcal{V}_{b}$. Unless otherwise stated, we use $a, b, c$ as channel names, $s, t$ as cell names, and $x, y, z$ as variables. Meta variables $u, v, w$ are used to range over both names and variables.

A signature $\Sigma$ consists of a finite set of function symbols, each with an arity. A function symbol with arity 0 is a constant. Function symbols are required to take arguments and produce results of the base sort only. Terms, ranged over by $M, N$, are built up from variables and names by function application:

$$
\begin{array}{rll}
M, N & ::= & \text { terms } \\
& a, b, c, k, m, n, s & \text { names } \\
& x, y, z & \text { variables } \\
& f\left(M_{1}, \ldots, M_{\ell}\right) & \text { function application }
\end{array}
$$

We write $\operatorname{var}(M)$ and $n a m e(M)$ for the variables and names in $M$, respectively. Tuples such as $u_{1} \cdots u_{\ell}$ and $M_{1} \cdots M_{\ell}$ will be denoted by $\widetilde{u}$ and $\widetilde{M}$, respectively. Terms are equipped with an equational theory $=_{\Sigma}$ that is an equivalence relation closed under substitutions of terms for variables, one-to-one renamings and function applications.

The grammar for the plain process is given below. The operators for nil process 0 , parallel composition |, replication!, scope restriction $\nu n$, conditional if - then - else, input $u(x)$ and output $\bar{u}\langle M\rangle$ are the same as the ones in applied pi calculus [3]. The process $[s \mapsto M]$ represents that the current value stored in a cell $s$ is $M$. The process lock $s . P$ locks the cell $s$ for the subsequent process $P$. When the cell $s$ is locked, another process that intends to access the cell has to wait until the cell is unlocked by a primitive unlock $s$. The process read $s$ as $x . P$ reads the value in the cell and stores
it in $x$. The process $s:=M . P$ assigns the value $M$ to the cell and continues as $P$.

| $P, Q, R::=$ | plain process |
| :--- | :--- |
| 0 | nil process |
| $P \mid Q$ | parallel composition |
| $!P$ | replication |
| $\nu n . P$ | name restriction |
| if $M=N$ then $P$ else $Q$ | conditional |
| $u(x) . P$ | input |
| $\bar{u}\langle M\rangle . P$ | output |
| $[s \mapsto M]$ | cell $s$, containing term $M$ |
| $s:=M . P$ | writing a cell |
| read $s$ as $x . P$ | reading a cell |
| lock $s . P$ | locking a cell |
| unlock $s . P$ | unlocking a cell |

subject to the following requirements:

- $x, M, N$ are not of cell sort; $u \in \mathcal{N}_{c h} \cup \mathcal{V}_{c h}$ and $s \in \mathcal{N}_{s}$; additionally, $M$ is of base sort in both $[s \mapsto M]$ and $s:=M . P$;
- for every lock $s . P$, the part $P$ of the process must not include parallel or replication unless it is after an unlock $s$.
- for a given cell name $s$, the replication operator! must not occur between $\nu s$ and $[s \mapsto M]$.

These side conditions rule out some nonsense processes, such as lock $s .!P$, lock $s$. $(P \mid Q), \nu s![s \mapsto M]$ and $\nu s .([s \mapsto M] \mid[s \mapsto N])$, while keep some reasonable processes, such as lock $s$.unlock $s .!P$, lock $s$.unlock $s .(P \mid Q)$ and ! $\nu s .[s \mapsto M]$.

An extended process, ranged over by $A, B, C$, is an expression of the form

$$
\nu \widetilde{n} .(\sigma, S, \mathcal{P})
$$

where

- $\nu \widetilde{n}$ is a set of name restrictions;
- $\sigma$ is a substitution $\left\{M_{1} / x_{1}, \ldots, M_{n} / x_{n}\right\}$ which replaces variables of base sort with terms of base sort; we define $\operatorname{dom}(\sigma):=\left\{x_{1}, \ldots, x_{n}\right\}$ and $\operatorname{dom}(\nu \widetilde{n} .(\sigma, S, \mathcal{P})):=$ $\operatorname{dom}(\sigma)$; we require that $\operatorname{dom}(\sigma) \cap f v\left(M_{1}, \ldots, M_{n}, \mathcal{P}, S\right)=\emptyset$;
- $S=\left\{s_{1} \mapsto M_{1}, \ldots, s_{m} \mapsto M_{m}\right\}$ is a set of state cells such that $s_{1}, \ldots, s_{m}$ are pairwise-distinct cell names and terms $M_{1}, \ldots, M_{m}$ are of base sort; we write $\operatorname{dom}(S)$ for $\left\{s_{1}, \ldots, s_{m}\right\}$ and $S\left(s_{i}\right)$ for $M_{i}(1 \leq i \leq m)$;
- $[s \mapsto M]$ can only occur at most once for a given cell name $s$, and if a cell name $s$ is not restricted by any $\nu s$, a state cell $s \mapsto M$ can only occur in $S$;
- $\mathcal{P}=\left\{\left(P_{1}, L_{1}\right), \ldots,\left(P_{k}, L_{k}\right)\right\}$ is a multiset of pairs where $P_{i}$ is a plain process and $L_{i}$ is a set of cell names; $L_{i} \cap L_{j}=\emptyset$ for any $1 \leq i, j \leq k$ and $i \neq j$; for each $s \in L_{i}$, the part of the process $P_{i}$ must not include parallel or replication unless it is after a unlock $s$; we write $\operatorname{locks}(\mathcal{P})$ for the set $L_{1} \cup \cdots \cup L_{k}$, namely the locked cells in $\mathcal{P}$.

In an extended process $\nu \widetilde{n} .(\sigma, S, \mathcal{P})$, the substitution $\sigma$ is similar to the active substitutions in applied pi calculus [3] which denote the static knowledge that the process exposes to the environment. A minor difference with [3] is that substitutions here are only defined on terms of base sort which will be explained later. State cells are mutable and the value of a cell may be changed during the running of processes. If a process $P$ locks a cell $s$, then this status information will be kept as $(P,\{s\} \cup L)$ in $\mathcal{P}$. At any time, the cell $s$ can be locked at most once in $\mathcal{P}$.

The variable $x$ in " $u(x)$ " and "read $s$ as $x$ " are bound, as well as the name $n$ in $\nu n$. This leads to the usual notions of bound and free names and variables. We shall use $f n(A)$ for free names, use $f s(A)$ for free cell names, use $f v(A)$ for free variables, use $b n(A)$ for bound names, and use $b v(A)$ for bound variables of $A$. Let $f n v(A)=$ $f n(A) \cup f v(A)$ and $b n v(A)=b n(A) \cup b v(A)$. Following the conventions in [35], we shall identify processes which are $\alpha$-convertible. We write " $=$ " for both syntactical equality and equivalence under $\alpha$-conversion. Captures of bound names and bound variables are avoided by implicit $\alpha$-conversion.

An extended process $\nu \widetilde{n} \cdot(\sigma, S, \mathcal{P})$ is called closed if the following conditions all hold: 1) each variable is either defined by $\sigma$ or bound; 2) each cell name $s$ is defined by exactly one " $s \mapsto M$ " (either in $S$ or in $\mathcal{P}$ ); 3) $\operatorname{locks}(\mathcal{P}) \subseteq \operatorname{dom}(S)$. Note that a variable defined in $\sigma$ will not occur in $S$ or $\mathcal{P}$ because of the condition $\operatorname{dom}(\sigma) \cap$ $f v\left(M_{1}, \ldots, M_{n}, \mathcal{P}, S\right)=\emptyset$ in the above definition of extended processes.

We may write $(\sigma, S, \mathcal{P})$ for $\nu \emptyset \cdot(\sigma, S, \mathcal{P})$, and write $\nu \widetilde{n}, \widetilde{m} .(\sigma, S, \mathcal{P})$ for $\nu(\widetilde{n} \cup$ $\tilde{m}) \cdot(\sigma, S, \mathcal{P})$.

When we write $\sigma=\sigma_{1} \cup \sigma_{2}$ for some substitution $\sigma$ or $S=S_{1} \cup S_{2}$ for some state cells $S$, we assume that $\operatorname{dom}\left(\sigma_{1}\right) \cap \operatorname{dom}\left(\sigma_{2}\right)=\emptyset$ as well as $\operatorname{dom}\left(S_{1}\right) \cap \operatorname{dom}\left(S_{2}\right)=\emptyset$. For variables $\widetilde{x}$, we define $\sigma_{\backslash \widetilde{x}}$ to be the substitution $\{z \sigma / z \mid z \in \operatorname{dom}(\sigma)$ and $z \notin \widetilde{x}\}$. If $A=\nu \widetilde{n} .(\sigma, S, \mathcal{P})$, we write $A_{\backslash \widetilde{x}}$ for $\nu \widetilde{n} .\left(\sigma_{\backslash \widetilde{x}}, S, \mathcal{P}\right)$.

An evaluation context $\nu \widetilde{n} .\left(\sigma-, S-, \mathcal{P}_{-}\right)$is an extended process with holes "-" for substitution, state cells and plain processes. Let $\mathcal{C}=\nu \widetilde{n} .\left(\sigma-, S-, \mathcal{P}_{-}\right)$be an evaluation context and $A=\nu \widetilde{m} \cdot\left(\sigma_{a}, S_{a}, \mathcal{P}_{a}\right)$ be a closed extended process with $\widetilde{m} \cap(\widetilde{n} \cup$ $f n(\sigma, S, \mathcal{P}))=\operatorname{dom}(\sigma) \cap \operatorname{dom}\left(\sigma_{a}\right)=\operatorname{dom}(S) \cap \operatorname{dom}\left(S_{a}\right)=\emptyset$. The result of applying $\mathcal{C}$ to $A$ is an extended process defined by:

$$
\mathcal{C}[A]=\nu \widetilde{n}, \widetilde{m} \cdot\left(\sigma \sigma_{a} \cup \sigma_{a}, S \sigma_{a} \cup S_{a}, \mathcal{P} \sigma_{a} \cup \mathcal{P}_{a}\right)
$$

An evaluation context $\mathcal{C}$ closes $A$ when $\mathcal{C}[A]$ is a closed extended process.
The main differences between our language and the language in StatVerif [8] are: 1) In our language, terms are divided into three types: base type, channel type and cell type, while StatVerif only has one universal type of terms. The active substitutions in our language are only defined on the terms of base type and terms can only be input and output on the terms of channel type, which is to fix the flaw of the coincidence result between labelled bisimilarity and observational equivalence [3] and will be further discussed in Section 5. Moreover, we don't allow input and output terms of cell
type which will be explained in the following Section 6.1. 2) Our language uses the $\alpha$-conversion to automatically change the bound names to avoid name collisions, while StatVerif uses a fixed set to record the bound names.

### 2.2. Operational Semantics

The transition relation $A \xrightarrow{\alpha} A^{\prime}$ is the smallest relation on extended processes defined by the rules in Figure 1 The action $\alpha$ is either an internal action $\tau$, an input $a(x)$, an output of channel name $\bar{a}\langle c\rangle$, an output of bound channel name $\nu c \cdot \bar{a}\langle c\rangle$, or an output of terms of base sort $\nu x . \bar{a}\langle x\rangle$. The transitions for conditional branch, communication, sending and receiving channel names and complex messages are typical and essentially the same as the ones in applied pi calculus. In particular, the output $\nu x . \bar{a}\langle x\rangle$ for term $M$ generates an "alias" $x$ for $M$ which is kept in the substitution part of the extended process. As mentioned before, state cells are used to model the hardware or the database to which the access is usually mutually-exclusive. When a state cell is locked, the other process that intends to access the cell must wait until the cell is released.

### 2.3. Case study

In this section, we demonstrate the intelligibility of our stateful applied pi calculus by comparing the formalisation of Trusted Platform Module (TPM) in applied pi calculus and its formalisation in stateful applied pi. Intelligibility of the translation from English specification of security protocols to formal model is important since the design of security protocols are error-prone and usually complicated.

State cells can be encoded by private channels which will be studied in the following Section 4 . The exclusive access to the cell is modelled by the unique features of private channels. For example, in process $\nu c .\left(\bar{c}\left|c \cdot a_{1} \cdot a_{2} \bar{c}\right| c \cdot b \cdot \bar{c}\right){ }^{1}$, the actions $a_{1}$ and $a_{2}$ cannot be interrupted by $b$. However, encoding state cells with private channels is pretty incomprehensible and not intuitive. For example. an input $c(x)$ on a private channel could be an input action, could also be an encoding for a lock or read primitive, or encoding for something else. We cannot be sure unless we analyse the semantics of the whole process. In comparison, when using stateful primitives (such as lock, read), the meaning can be interpreted immediately from their syntax, and it reminds the reader here is an operation on state cells rather than an ordinary sending or receiving a message on a channel. We illustrate this point by a case study on modelling the Trusted Platform Module (TPM).

Overview of Trusted Platform Module (TPM). TPM is a hardware chip designed to enable commodity computers to achieve greater levels of security. TPMs are manufactured by chip producers, including Atmel, Broadcom, Infineon, Sinosun, STMicroelectronics, and Winbond. It is specified by the Trusted Computing Group (TCG) industry consortium. The TPM offers an application program interface (API) providing operations related to:

\end{aligned}
$$
\]

Figure 1: Operational Semantics

- Platform configuration registers (PCRs): the TPM contains at least 16 PCRs in its shielded memory which store platform configuration measurements. The only operation for changing the value $u$ of a PCR is to extend it by a value $v$, resulting in the PCR value hash $(u, v)$. A PCR can be either static or dynamic. For simplicity, in our formal model, we assume TPM only has two PCRs: a static PCR and a dynamic PCR. A system reboot will reset the value in the static PCRs and dynamic PCRs to -1 . Only an SKINIT instruction (described below) can reset a dynamic PCR to 0 . This enables a remote verifier to distinguish between a reboot and a dynamic reset.
- Secure key management and storage: the TPM can generate new keys, and impose restrictions on their use. TPMs provide sealed storage, whereby data can be encrypted using a 2048-bit RSA key whose private component never leaves the TPM in unencrypted form. For simplicity, in our formalisation, we assume the data is encrypted directly under the storage root key (SRK). The SRK is a pair of RSA keys that is used to encrypt other keys stored outside the TPM. SRK is embedded in the TPM. The sealed data can be bound to a particular software state, as defined by the contents of various PCRs. The TPM will only unseal (decrypt) the data when the PCRs contain the values specified by the seal command.

Seal function encrypts a secret $m$ with a public key $\mathrm{pk}(k)$, a specific PCR value $v$ and a secret tpmpf as aenc $(\operatorname{pk}(k), t p m p f, v, m)$. The decryption is modelled as an equation $\operatorname{adec}(x, \operatorname{aenc}(\operatorname{pk}(x), y, z, u))=\langle y, z, u\rangle$.

- The SKINIT instruction creates an isolated execution environment in which securitysensitive code can be protected from all other software and devices. The code to be executed within this protected environment is called Secure Loader Block (SLB). The SKINIT instruction takes the physical memory address of SLB as its only argument. The SKINIT instruction resets the value of a dynamic PCR to 0 , transmits a copy of the SLB to the system's TPM and extends the value of PCR with the measurement of the SLB, and then begins to execute the SLB.

Each command (e.g., reboot, extend) on TPM is executed atomically without interruption. To formalise TPM, we introduce three state cells: state cell tpm for access control, state cell spcr for static PCR, and state cell $d p c r$ for dynamic PCR. The operations on TPM include reboot, extend, skinit and we assume these commands are sent on the corresponding public channels reboot, extend, skinit. These operations are modelled as processes REBOOT, EXTEND, SKINIT correspondingly. The formalisation of TPM in applied pi calculus is given in Figure 2 and the formalisation of TPM in stateful applied pi calculus is given in Figure 3

Syntax Sugar. We write "let $\langle x, y\rangle=M$ in $P$ " for " $P\{$ fst $(M) / x$, snd $(M) / y\}$ ", and similarly "let $\langle x, y, z\rangle=M$ in $P$ " for " $P\{\mathrm{fst}(M) / x, \operatorname{snd}(M) / y, \operatorname{trd}(M) / z\}$ ".

## 3. Process Equivalences for Private State Cells

In this section, we discuss the language features of stateful applied pi with only private state cells, that is, each cell name $s$ occurring in the processes is within the scope

Figure 3: Modelling TPM in stateful applied pi calculus
of a restriction $\nu s$. We first present the coincidence between observational equivalence and labelled bisimilarity on the extended processes with only private state cells. Then we propose an encoding of private cells by using restricted channel names.

### 3.1. Observational Equivalence

For private state cells, we define observational equivalence in a similar way as in [3]. Observational equivalence [3] has been widely used to model properties of security protocols. It captures the intuition of indistinguishability from the attacker's point of view. Security properties such as anonymity [4], privacy [22, 6] and strong secrecy [13] are usually formalised by observational equivalence.

We write $\Longrightarrow$ for the reflexive and transitive closure of $\xrightarrow{\tau}$; we define $\xrightarrow{\alpha}$ to be $\Longrightarrow \stackrel{\alpha}{\Longrightarrow} \Longrightarrow$; we define $\xlongequal{\widehat{\alpha}}$ to be $\xlongequal{\alpha}$ if $\alpha$ is not $\tau$ and $\Longrightarrow$ if $\alpha=\tau$. We write $A \Downarrow_{a}$ when $A \Longrightarrow \nu \widetilde{n} .(\sigma, S, \mathcal{P} \cup\{(\bar{a}\langle M\rangle . P, L)\})$ with $a \notin \widetilde{n}$.

Definition 1. Observational equivalence $(\approx)$ is the largest symmetric relation $\mathcal{R}$ on pairs of closed extended processes with only private state cells, such that $A \mathcal{R} B$ implies
(i) $\operatorname{dom}(A)=\operatorname{dom}(B)$;
(ii) if $A \Downarrow_{a}$ then $B \Downarrow_{a}$;
(iii) if $A \Longrightarrow A^{\prime}$ then $B \Longrightarrow B^{\prime}$ and $A^{\prime} \mathcal{R} B^{\prime}$ for some $B^{\prime}$;
(iv) for all closing evaluation contexts $\mathcal{C}$ with only private cells, $\mathcal{C}[A] \mathcal{R} \mathcal{C}[B]$.

Observational equivalence is a contextual equivalence where the contexts model the active attackers who can intercept and forge messages. In the following examples, we illustrate the use of observational equivalence in the stateful language by analysing the untraceability of the RFID tags.

Example 2. We start by analysing a naive protocol for RFID tag identification. The tag simply reads its id and sends it to the reader. We assume the attacker can eavesdrop on the radio frequency signals between the tag and the reader. In other words, all the communications between the tag and the reader are visible to the attacker. The operations on the tag can be modelled by: $P(s)=\operatorname{read} s$ as $x . \bar{a}\langle x\rangle$. One security concern for RFID tags is to avoid third-party attacker tracking. The attacker is not supposed to trace the tag according to its outputs. Using the definition in [6], the untraceability can be modelled by observational equivalence:

$$
(\emptyset, \emptyset,\{(!\nu s, i d .([s \mapsto i d] \mid P(s)), \emptyset)\}) \approx(\emptyset, \emptyset,\{(!\nu s, i d .([s \mapsto i d] \mid!P(s)), \emptyset)\})
$$

In the left process, each tag s can be used at most once. In the right process, each tag $s$ can be used an unbounded number of times. The above equivalence does not hold, which means this protocol is traceable. By eavesdropping on channel a of the right process, the attacker can get a data sequence: "id, id, id...", while a particular id can occur at most once in the first process.

Example 3. The OSK protocol [28] is a simple identification protocol for RFID tags which aims to satisfy third-party untraceability. The tag can perform two independent one-way functions $g$ and $h$. An initial secret is stored in the tag and is known to the back-end database. On each run of the protocol, the tag computes the hash $g$ of its current value and sends the result to the reader. The reader forwards the message to the back-end database for identification. The tag then updates its value with the hash $h$ of its current value. The operations related to a tag s can be modelled by:

$$
T(s)=\text { lock } s . \text { read } s \text { as } x . \bar{a}\langle g(x)\rangle . s:=h(x) . \text { unlock } s
$$

Let RD be process modelling the reader and back-end database. Similar to Example 2 the untraceability can be represented by

$$
\begin{aligned}
& (\emptyset, \emptyset,\{(!\nu s, k \cdot([s \mapsto k]|T(s)| R D), \emptyset)\}) \\
\approx & (\emptyset, \emptyset,\{(!\nu s, k \cdot([s \mapsto k]|!T(s)| R D), \emptyset)\})
\end{aligned}
$$

In the second process, for a particular tag $s$ which contains value $k$, the data sequence observed by the attacker on channel a is " $g(k), g(h(k)), g(h(h(k))) \cdots$ ". Without knowing the secret $k$, these appear just random data to the attacker and so the attacker cannot link these data to the same tag. The observational equivalence between these two processes means the attacker cannot identify the multiple runnings of a particular tag. The "lock $s \cdots$ unlock $s$ " ensures exclusive access to the tag. After the reader reads the tag, the tag must be renewed before the next access to the tag; otherwise the tag would be traceable.

### 3.2. Labelled Bisimilarity

The universal quantifier over the contexts makes it difficult to prove observational equivalence. Hence labelled bisimilarity is introduced in [3] to capture observational equivalence. Labelled bisimilarity consists of static equivalence and behavioural equivalence.

Definition 4. Two processes $A$ and $B$ are statically equivalent, written as $A \approx_{s} B$, if $\operatorname{dom}(A)=\operatorname{dom}(B)$, and for any terms $M$ and $N$ with $\operatorname{var}(M, N) \subseteq \operatorname{dom}(A)$, $M \sigma_{1}=_{\Sigma} N \sigma_{1}$ iff $M \sigma_{2}=_{\Sigma} N \sigma_{2}$ where $A=\nu \widetilde{n}_{1} \cdot\left(\sigma_{1}, S_{1}, \mathcal{P}_{1}\right)$ and $B=\nu \widetilde{n}_{2} \cdot\left(\sigma_{2}, S_{2}, \mathcal{P}_{2}\right)$ for some $\widetilde{n}_{1}, \widetilde{n}_{2}$ such that $\left(\widetilde{n}_{1} \cup \widetilde{n}_{2}\right) \cap \operatorname{name}(M, N)=\emptyset$.

Our definition of static equivalence is essentially the same as the one in [3], as the definition in [3] is invariant under structural equivalence already. Although static equivalence is in general undecidable, there are well established ways, including tools, for verifying static equivalence [2, 17, 18, 10, 16]. Static equivalence defines the indistinguishability between the environmental knowledge exposed by two processes. The environmental knowledge is modelled by the substitutions in the extended processes. For example, let $A=\nu k, m \cdot(\{k / x, m / y\}, \emptyset, \emptyset)$ and $B=\nu k .(\{k / x, h(k) / y\}, \emptyset, \emptyset)$. The test $h(x)=y$ fails under the application of $A$ 's substitution $\{k / x, m / y\}$, while succeeds under the application of $B$ 's substitution $\{k / x, h(k) / y\}$. Hence $A \not \boldsymbol{z}_{s} B$.

Definition 5. Labelled bisimilarity $\left(\approx_{l}\right)$ is the largest symmetric relation $\mathcal{R}$ between pairs of closed extended processes with only private state cells such that $A \mathcal{R}$ B implies

1. $A \approx_{s} B$;
2. if $A \xrightarrow{\alpha} A^{\prime}$ and $f v(\alpha) \subseteq \operatorname{dom}(A)$ and $b n(\alpha) \cap f n(B)=\emptyset$, then $B \xrightarrow{\widehat{\alpha}} B^{\prime}$ such that $A^{\prime} \mathcal{R} B^{\prime}$ for some $B^{\prime}$.

Instead of using arbitrary contexts, labelled bisimilarity relies on the direct comparison of the transitions.

### 3.3. Soundness and Completeness

In this section, we show that when there is only private state cells in the language, labelled bisimilarity can fully capture observational equivalence. For an evaluation context $\mathcal{C}$, we write $\mathcal{C}[A]_{\backslash \widetilde{x}}$ for the process $(\mathcal{C}[A])_{\overparen{x}}$. We write $\prod_{i \in I} P_{i}$ for the parallel composition $P_{1}\left|P_{2}\right| \cdots \mid P_{|I|}$.

The following Lemma 6 states that the labelled bisimilarity is closed under the application of contexts:

Lemma 6. Let $A$ be a closed extended process with only private state cells and $\mathcal{C}=$ $\nu \widetilde{n} .(\sigma-, S-, \mathcal{P}-)$ be a closing evaluation context with only private state cells and $\widetilde{x} \subseteq$ $\operatorname{dom}(A)$.

1. If $A \xrightarrow{c(M \sigma)} B$ with name $(c, M) \cap \widetilde{n}=\emptyset$ and $\operatorname{var}(M) \subseteq \operatorname{dom}(\mathcal{C}[A] \backslash \widetilde{x})$, then $\mathcal{C}[A]_{\backslash \tilde{x}} \xrightarrow{c(M)} \mathcal{C}[B]_{\backslash \tilde{x}} ;$
2. If $A \xrightarrow{\alpha} B$ with name $(\alpha) \cap \widetilde{n}=\emptyset$ and $\operatorname{var}(\alpha) \cap \widetilde{x}=\emptyset$, then $\mathcal{C}[A]_{\backslash \widetilde{x}} \xrightarrow{\alpha} \mathcal{C}[B]_{\backslash \widetilde{x}}$ when $\alpha$ is not an input.

Proof. Proof can be found in Appendix A
Using Lemma 6 several times, we can obtain the following corollary:
Corollary 7. Let $A$ be a closed extended process with only private state cells and $\mathcal{C}=\nu \widetilde{n} .(\sigma-, S-, \mathcal{P}-)$ be a closing evaluation context with only private state cells and $\widetilde{x} \subseteq \operatorname{dom}(A)$.

1. If $A \stackrel{c(M \sigma)}{\Longrightarrow} B$ with name $(c, M) \cap \tilde{n}=\emptyset$ and $\operatorname{var}(M) \subseteq \operatorname{dom}(\mathcal{C}[A] \backslash \widetilde{x})$, then $\mathcal{C}[A]_{\backslash \widetilde{x}} \stackrel{c(M)}{\Longrightarrow} \mathcal{C}[B]_{\backslash \widetilde{x}} ;$
2. If $A \xlongequal{\alpha} B$ with name $(\alpha) \cap \widetilde{n}=\emptyset$ and $\operatorname{var}(\alpha) \cap \widetilde{x}=\emptyset$, then $\mathcal{C}[A]_{\backslash \widetilde{x}} \xlongequal{\alpha} \mathcal{C}[B]_{\backslash_{x}}$ when $\alpha$ is not an input.

We first prove that labelled bisimilarity is sound w.r.t. observational equivalence. That is to say the labelled bisimilarity is closed under the application of arbitrary context:

Proposition 8 (Soundness). On closed extended processes with only private state cells, the labelled bisimilarity $\approx_{l}$ is a congruence.

Proof. We prove that $\approx_{l}$ is a congruence by constructing the following set

$$
\begin{aligned}
& \mathcal{R}=\left\{\left(\mathcal{C}\left[A_{1}\right], \mathcal{C}\left[A_{2}\right]\right) \mid A_{1} \approx_{l} A_{2}, \mathcal{C}\right. \text { is a closing evaluation } \\
&\quad \text { context with only private state cells }\}
\end{aligned}
$$

and prove that $\mathcal{R} \subseteq \approx_{l}$.
Assume $\left(\mathcal{C}\left[A_{1}\right], \mathcal{C}\left[A_{2}\right]\right) \in \mathcal{R}$ because of $A_{1} \approx_{l} A_{2}$ where $A_{i}=\nu \widetilde{n}_{i} .\left(\sigma_{i}, S_{i}, \mathcal{P}_{i}\right)$ with $i=1,2$ and $\mathcal{C}=\nu \widetilde{n} .(\sigma-, S-, \mathcal{P}-)$. Then $\mathcal{C}\left[A_{i}\right]=\nu \widetilde{n}, \widetilde{n}_{i} .\left(\sigma \sigma_{i} \cup \sigma_{i}, S \sigma_{i} \cup S_{i}, \mathcal{P} \sigma_{i} \cup\right.$ $\mathcal{P}_{i}$ ). To prove $\mathcal{R} \subseteq \approx_{l}$, we need to show $\mathcal{C}\left[A_{1}\right] \approx_{s} \mathcal{C}\left[A_{2}\right]$, and if $\mathcal{C}\left[A_{1}\right] \xrightarrow{\alpha} B_{1}$ for some $B_{1}$ then there exists $B_{2}$ such that $\mathcal{C}\left[A_{2}\right] \stackrel{\widehat{\alpha}}{\Longrightarrow} B_{2}$ and $\left(B_{1}, B_{2}\right) \in \mathcal{R}$.

First we check the static equivalence $\mathcal{C}\left[A_{1}\right] \approx_{s} \mathcal{C}\left[A_{2}\right]$. Let $\varphi_{i}=\sigma \sigma_{i} \cup \sigma_{i}$ with $i=1,2$. From $\operatorname{dom}\left(\sigma_{1}\right)=\operatorname{dom}\left(\sigma_{2}\right)$, we have $\operatorname{dom}\left(\varphi_{1}\right)=\operatorname{dom}\left(\varphi_{2}\right)$. Note that for any term $M$ with $\operatorname{var}(M) \subseteq \operatorname{dom}\left(\varphi_{i}\right)$, we have $M \varphi_{i}=(M \sigma) \sigma_{i}$ and $\operatorname{var}(M \sigma) \subseteq$ $\operatorname{dom}\left(\sigma_{i}\right)$ since $\operatorname{dom}(\sigma) \cap \operatorname{dom}\left(\sigma_{i}\right)=\emptyset$ and $\mathcal{C}$ is a closing evaluation context to $A_{i}$. Assume terms $M, N$ with $\operatorname{var}(M, N) \subseteq \operatorname{dom}\left(\varphi_{i}\right)$ and $M \varphi_{1}=_{\Sigma} N \varphi_{1}$. We shall prove that $M \varphi_{2}=_{\Sigma} N \varphi_{2}$. From the above analysis, we have $(M \sigma) \sigma_{1}=M \varphi_{1},(N \sigma) \sigma_{1}=$ $N \varphi_{1},(M \sigma) \sigma_{1}=_{\Sigma}(N \sigma) \sigma_{1}$ and $\operatorname{var}(M \sigma, N \sigma) \subseteq \operatorname{dom}\left(\sigma_{i}\right)$. Since $A_{1} \approx_{s} A_{2}$, we have $(M \sigma) \sigma_{2}=_{\Sigma}(N \sigma) \sigma_{2}$. From $(M \sigma) \sigma_{2}=M \varphi_{2}$ and $(N \sigma) \sigma_{2}=N \varphi_{2}$, we have $M \varphi_{2}={ }_{\Sigma} N \varphi_{2}$. Hence we have $\mathcal{C}\left[A_{1}\right] \approx_{s} \mathcal{C}\left[A_{2}\right]$.

For the behavioural equivalence, we discuss the different cases of $\alpha$. For each transition $\mathcal{C}\left[A_{1}\right] \xrightarrow{\alpha} B_{1}$, we need to find some matched transitions $\mathcal{C}\left[A_{2}\right] \xrightarrow{\widehat{\alpha}} B_{2}$ such that $\left(B_{1}, B_{2}\right) \in \mathcal{R}$.

1. Assume a transition is about reading a cell $s$ and

$$
\mathcal{C}\left[A_{1}\right]=\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, S \sigma_{1} \cup S_{1}, \mathcal{P} \sigma_{1} \cup \mathcal{P}_{1}\right) \xrightarrow{\tau} B_{1}
$$

The "read $s$ as $z$ " comes either from the context $\mathcal{C}$ or from the process $A_{1}$.
(a) Assume read $s$ as $z$ is from the context $\mathcal{C}$. Since $A_{1}, A_{2}$ only contain private state cells, the context $\mathcal{C}$ cannot access any private state cells in $A_{1}, A_{2}$. Thus $s$ can only be a cell defined in $S$ in context $\mathcal{C}$. Assume $\mathcal{C}=\nu \widetilde{n} .\left(\sigma-, S^{\prime} \cup\{s \mapsto M\}-, \mathcal{P}^{\prime} \cup\right.$ $\left\{\left(\operatorname{read} s\right.\right.$ as $\left.\left.\left.z . P \sigma_{1}, L\right)\right\}-\right)$, then

$$
\begin{aligned}
& \mathcal{C}\left[A_{1}\right]= \\
& \nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, S^{\prime} \sigma_{1} \cup\left\{s \mapsto M \sigma_{1}\right\} \cup S_{1}, \mathcal{P}^{\prime} \sigma_{1} \cup\left\{\left(\operatorname{read} s \text { as } \boldsymbol{z . P} \boldsymbol{\sigma}_{1}, L\right)\right\} \cup \mathcal{P}_{1}\right) \\
& \stackrel{\tau}{\longrightarrow} B_{1}= \\
& \nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, S^{\prime} \sigma_{1} \cup\left\{s \mapsto M \sigma_{1}\right\} \cup S_{1}, \mathcal{P}^{\prime} \sigma_{1} \cup\left\{\left(\left(\boldsymbol{P} \boldsymbol{\sigma}_{1}\right)\left\{\boldsymbol{M} \boldsymbol{\sigma}_{\mathbf{1}} / \boldsymbol{z}\right\}, L\right)\right\} \cup \mathcal{P}_{1}\right) \\
& =\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, S^{\prime} \sigma_{1} \cup\left\{s \mapsto M \sigma_{1}\right\} \cup S_{1}, \mathcal{P}^{\prime} \sigma_{1} \cup\left\{\left((\boldsymbol{P}\{\boldsymbol{M} / \boldsymbol{z}\}) \boldsymbol{\sigma}_{\mathbf{1}}, L\right)\right\} \cup \mathcal{P}_{1}\right)
\end{aligned}
$$

From the structure of $\mathcal{C}$, we can have the following transitions from $\mathcal{C}\left[A_{2}\right]$ :

$$
\begin{aligned}
& \mathcal{C}\left[A_{2}\right]=\nu \widetilde{n}, \widetilde{n}_{2} \cdot\left(\sigma \sigma_{2} \cup \sigma_{2}, S^{\prime} \sigma_{2} \cup\left\{s \mapsto M \sigma_{2}\right\} \cup S_{2}, \mathcal{P} \boldsymbol{\sigma}_{\mathbf{2}} \cup \mathcal{P}_{2}\right) \\
& =\nu \widetilde{n}, \widetilde{n}_{2} \cdot\left(\sigma \sigma_{2} \cup \sigma_{2}, S^{\prime} \sigma_{2} \cup\left\{s \mapsto M \sigma_{2}\right\} \cup S_{2}, \mathcal{P}^{\prime} \boldsymbol{\sigma}_{\mathbf{2}} \cup\left\{\left(\mathrm{read} \boldsymbol{s} \text { as } \boldsymbol{z} . \boldsymbol{P} \boldsymbol{\sigma}_{\mathbf{2}}, L\right)\right\} \cup \mathcal{P}_{2}\right) \\
& \stackrel{\tau}{\longrightarrow} B_{2}= \\
& \nu \widetilde{n}, \widetilde{n}_{2} \cdot\left(\sigma \sigma_{2} \cup \sigma_{2}, S^{\prime} \sigma_{2} \cup\left\{s \mapsto M \sigma_{2}\right\} \cup S_{2}, \mathcal{P}^{\prime} \sigma_{2} \cup\left\{\left(\left(\boldsymbol{P} \boldsymbol{\sigma}_{2}\right)\left\{\boldsymbol{M} \boldsymbol{\sigma}_{\mathbf{2}} / \boldsymbol{z}\right\}, L\right)\right\} \cup \mathcal{P}_{2}\right) \\
& =\nu \widetilde{n}, \widetilde{n}_{2} \cdot\left(\sigma \sigma_{2} \cup \sigma_{2}, S^{\prime} \sigma_{2} \cup\left\{s \mapsto M \sigma_{2}\right\} \cup S_{2}, \mathcal{P}^{\prime} \sigma_{2} \cup\left\{\left((\boldsymbol{P}\{\boldsymbol{M} / \boldsymbol{z}\}) \boldsymbol{\sigma}_{\mathbf{2}}, L\right)\right\} \cup \mathcal{P}_{2}\right)
\end{aligned}
$$

Let $\mathcal{C}^{\prime}=\nu \widetilde{n} .\left(\sigma-, S-, \mathcal{P}_{2}^{\prime} \cup\{(P\{M / z\}, L)\}-\right)$. Then we can verify that $\mathcal{C}^{\prime}\left[A_{i}\right]=B_{i}$ for $i=1,2$. Since $A_{1} \approx_{l} A_{2}$, we have $\left(B_{1}, B_{2}\right) \in \mathcal{R}$.
(b) Assume read $s$ as $z$ is from the process and

$$
A_{1}=\nu \widetilde{n}_{1} \cdot\left(\sigma_{1}, S_{1}^{\prime} \cup\{s \mapsto M\},\{(\text { read } s \text { as } z \cdot P, L)\} \cup \mathcal{P}_{1}^{\prime}\right)
$$

Then

$$
\begin{aligned}
\mathcal{C}\left[A_{1}\right] & =\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, S \sigma_{1} \cup S_{1}^{\prime} \cup\{s \mapsto M\}, \mathcal{P} \sigma_{1} \cup\{(\operatorname{read} s \text { as } \boldsymbol{z} \cdot \boldsymbol{P}, L)\} \cup \mathcal{P}_{1}^{\prime}\right) \\
\xrightarrow{\tau} B_{1} & =\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\left(\sigma \sigma_{1} \cup \sigma_{1}, S \sigma_{1} \cup S_{1}^{\prime} \cup\{s \mapsto M\}, \mathcal{P} \sigma_{1} \cup\{(\boldsymbol{P}\{\boldsymbol{M} / \boldsymbol{z}\}, L)\} \cup \mathcal{P}_{1}^{\prime}\right)\right)
\end{aligned}
$$

Then $A_{1}$ can perform the read action and

$$
\begin{aligned}
A_{1} & =\nu \widetilde{n}_{1} \cdot\left(\sigma_{1}, S_{1} \cup S_{1}^{\prime} \cup\{s \mapsto M\}, \mathcal{P}_{1}^{\prime} \cup\{(\operatorname{read} s \text { as } \boldsymbol{z} \cdot \boldsymbol{P}, L)\}\right) \\
& \xrightarrow{\tau} A_{1}^{\prime}=\nu \widetilde{n}_{1} \cdot\left(\sigma_{1}, S_{1} \cup S_{1}^{\prime} \cup\{s \mapsto M\}, \mathcal{P}_{1}^{\prime} \cup\{(\boldsymbol{P}\{\boldsymbol{M} / \boldsymbol{z}\} x, L)\}\right)
\end{aligned}
$$

and $\mathcal{C}\left[A_{1}^{\prime}\right]=B_{1}$. From $A_{1} \approx_{l} A_{2}$, there exists $A_{2}^{\prime}$ such that $A_{2} \Longrightarrow A_{2}^{\prime} \approx_{l} A_{1}^{\prime}$. Using Corollary 7 we obtain $\mathcal{C}\left[A_{2}\right] \Longrightarrow \mathcal{C}\left[A_{2}^{\prime}\right]$. Let $B_{2}=\mathcal{C}\left[A_{2}^{\prime}\right]$. Hence $\left(B_{1}, B_{2}\right) \in$ $\mathcal{R}$.
2. Assume a transition is about locking a cell $s$ and

$$
\mathcal{C}\left[A_{1}\right]=\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, S \sigma_{1} \cup S_{1}, \mathcal{P} \sigma_{1} \cup \mathcal{P}_{1}\right) \xrightarrow{\tau} B_{1}
$$

and $s \in \widetilde{n} \cup \widetilde{n}_{1}$ and $s \notin \operatorname{locks}\left(\mathcal{P}_{1}, \mathcal{P}\right)$. The lock $s$ comes either from $\mathcal{P}$ in the context part or from $\mathcal{P}_{1}$ in the process part.
(a) Assume lock $s$ is from the context part and $\mathcal{P}=\mathcal{P}^{\prime} \cup\{($ lock $s . P, L)\}$.

$$
\begin{aligned}
& \mathcal{C}\left[A_{1}\right]=\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, S \sigma_{1} \cup S_{1}, \mathcal{P}^{\prime} \sigma_{1} \cup\left\{\left(\text { lock } s . \boldsymbol{P} \sigma_{1}, L\right)\right\} \cup \mathcal{P}_{1}\right) \\
& \xrightarrow{\tau} B_{1}=\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, S \sigma_{1} \cup S_{1}, \mathcal{P}^{\prime} \sigma_{1} \cup\left\{\left(\boldsymbol{P} \sigma_{1}, \boldsymbol{L} \cup\{s\}\right)\right\} \cup \mathcal{P}_{1}\right)
\end{aligned}
$$

Since $A_{1}, A_{2}$ only contain private state cells, the context $\mathcal{C}$ cannot access any private state cells in $A_{1}, A_{2}$. Thus $s$ is a state cell from context $\mathcal{C}$. We can have the following transitions from $\mathcal{C}\left[A_{2}\right]$ :

$$
\begin{aligned}
\mathcal{C}\left[A_{2}\right] & =\nu \widetilde{n}, \widetilde{n}_{2} \cdot\left(\sigma \sigma_{2} \cup \sigma_{2}, S \sigma_{2} \cup S_{2}, \boldsymbol{\mathcal { P }} \boldsymbol{\sigma}_{2} \cup \mathcal{P}_{2}\right) \\
& =\nu \widetilde{n}, \widetilde{n}_{2} \cdot\left(\sigma \sigma_{2} \cup \sigma_{2}, S \sigma_{2} \cup S_{2}, \mathcal{P}^{\prime} \sigma_{2} \cup\left\{\left(\text { lock } \boldsymbol{s} . \boldsymbol{P} \boldsymbol{\sigma}_{\mathbf{2}}, \boldsymbol{L}\right)\right\} \cup \mathcal{P}_{2}\right) \\
\xrightarrow[\rightarrow]{\tau} B_{2} & =\nu \widetilde{n}, \widetilde{n}_{2} \cdot\left(\sigma \sigma_{2} \cup \sigma_{2}, S \sigma_{2} \cup S_{2}, \mathcal{P}^{\prime} \sigma_{2} \cup\left\{\left(\boldsymbol{P} \boldsymbol{\sigma}_{2}, \boldsymbol{L} \cup\{\boldsymbol{s}\}\right)\right\} \cup \mathcal{P}_{2}\right)
\end{aligned}
$$

Let $\mathcal{C}^{\prime}=\nu \widetilde{n} \cdot\left(\sigma-, S-, \mathcal{P}^{\prime} \cup\{(P, L \cup\{s\})\}-\right)$. Then we can verify that $\mathcal{C}^{\prime}\left[A_{i}\right]=B_{i}$ for $i=1,2$. Since $A_{1} \approx_{l} A_{2}$, we have $\left(B_{1}, B_{2}\right) \in \mathcal{R}$.
(b) Assume $\mathcal{P}_{1}=\mathcal{P}_{1}^{\prime} \cup\{($ lock s.P,$L)\}$ and

$$
\begin{aligned}
& \mathcal{C}\left[A_{1}\right]=\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, S \sigma_{1} \cup S_{1}, \mathcal{P} \sigma_{1} \cup\{(\text { lock } s . \boldsymbol{P}, \boldsymbol{L})\} \cup \mathcal{P}_{1}^{\prime}\right) \\
& \xrightarrow{\tau} B_{1}=\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, S \sigma_{1} \cup S_{1}, \mathcal{P} \sigma_{1} \cup\{(\boldsymbol{P}, \boldsymbol{L} \cup\{s\})\} \cup \mathcal{P}_{1}^{\prime}\right)
\end{aligned}
$$

Then $A_{1}$ can perform the lock action and

$$
\begin{aligned}
A_{1}= & \nu \widetilde{n}_{1} \cdot\left(\sigma_{1}, S_{1}, \mathcal{P}_{1}^{\prime} \cup\{(\text { lock } \boldsymbol{s} \cdot \boldsymbol{P}, \boldsymbol{L})\}\right) \\
& \xrightarrow{\tau} A_{1}^{\prime}=\nu \widetilde{n}_{1} \cdot\left(\sigma_{1}, S_{1}, \mathcal{P}_{1}^{\prime} \cup\{(\boldsymbol{P}, \boldsymbol{L} \cup\{s\})\}\right)
\end{aligned}
$$

and $\mathcal{C}\left[A_{1}^{\prime}\right]=B_{1}$. From $A_{1} \approx_{l} A_{2}$, there exists $A_{2}^{\prime}$ such that $A_{2} \Longrightarrow A_{2}^{\prime} \approx_{l} A_{1}^{\prime}$. Using Corollary 7 we obtain $\mathcal{C}\left[A_{2}\right] \Longrightarrow \mathcal{C}\left[A_{2}^{\prime}\right]$. Let $B_{2}=\mathcal{C}\left[A_{2}^{\prime}\right]$. We know that $\left(B_{1}, B_{2}\right) \in \mathcal{R}$.
3. The analysis for cases when the transition is caused by writing or unlocking is similar as above.
4. Assume

$$
\mathcal{C}\left[A_{1}\right]=\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, S \sigma_{1} \cup S_{1}, \mathcal{P} \sigma_{1} \cup \mathcal{P}_{1}\right) \xrightarrow{\bar{a}\langle c\rangle} B_{1}
$$

The output comes either from $\mathcal{P}$ in the context part or from $\mathcal{P}_{1}$ in the process part.
(a) Assume the output is from the context part and $\mathcal{P}=\mathcal{P}^{\prime} \cup\{(\bar{a}\langle c\rangle . P, L)\}$.

$$
\begin{aligned}
\mathcal{C}\left[A_{1}\right] & =\nu \widetilde{n}, \tilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, S \sigma_{1} \cup S_{1}, \mathcal{P}^{\prime} \sigma_{1} \cup\left\{\left(\overline{\boldsymbol{a}}\langle\boldsymbol{c}\rangle . \boldsymbol{P} \boldsymbol{\sigma}_{1}, L\right)\right\} \cup \mathcal{P}_{1}\right) \\
\stackrel{\bar{a}\langle c\rangle}{ } B_{1} & =\nu \widetilde{n}, \tilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, S \sigma_{1} \cup S_{1}, \mathcal{P}^{\prime} \sigma_{1} \cup\left\{\left(\boldsymbol{P} \boldsymbol{\sigma}_{1}, L\right)\right\} \cup \mathcal{P}_{1}\right)
\end{aligned}
$$

Since the output comes from context, we can have the following transitions from $\mathcal{C}\left[A_{2}\right]:$

$$
\begin{aligned}
\mathcal{C}\left[A_{2}\right] & =\nu \widetilde{n}, \widetilde{n}_{2} \cdot\left(\sigma \sigma_{2} \cup \sigma_{2}, S \sigma_{2} \cup S_{2}, \boldsymbol{P} \boldsymbol{\sigma}_{\mathbf{2}} \cup \mathcal{P}_{2}\right) \\
& =\nu \widetilde{n}, \widetilde{n}_{2} \cdot\left(\sigma \sigma_{2} \cup \sigma_{2}, S \sigma_{2} \cup S_{2}, \boldsymbol{P}^{\prime} \boldsymbol{\sigma}_{\mathbf{2}} \cup\left\{\left(\overline{\boldsymbol{a}}\langle\boldsymbol{c}\rangle . \boldsymbol{P} \boldsymbol{\sigma}_{\mathbf{2}}, \boldsymbol{L}\right)\right\} \cup \mathcal{P}_{2}\right) \\
\xrightarrow{\bar{a}\langle c\rangle} B_{2} & =\nu \widetilde{n}, \widetilde{n}_{2} \cdot\left(\sigma \sigma_{2} \cup \sigma_{2}, S \sigma_{2} \cup S_{2}, \mathcal{P}^{\prime} \sigma_{2} \cup\left\{\left(\boldsymbol{P} \boldsymbol{\sigma}_{\mathbf{2}}, L\right)\right\} \cup \mathcal{P}_{2}\right)
\end{aligned}
$$

Let $\mathcal{C}^{\prime}=\nu \widetilde{n} .\left(\sigma-, S-, \mathcal{P}_{2}^{\prime} \cup\{(P, L)\}-\right)$. Then we can verify that $\mathcal{C}^{\prime}\left[A_{i}\right]=B_{i}$ for $i=1,2$. Since $A_{1} \approx_{l} A_{2}$, we have $\left(B_{1}, B_{2}\right) \in \mathcal{R}$.
(b) Assume $\mathcal{P}_{1}=\mathcal{P}_{1}^{\prime} \cup\{(\bar{a}\langle c\rangle . P, L)\}$ and

$$
\begin{aligned}
\mathcal{C}\left[A_{1}\right] & =\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, S \sigma_{1} \cup S_{1}, \mathcal{P} \sigma_{1} \cup\{(\overline{\boldsymbol{a}}\langle\boldsymbol{c}\rangle \cdot \boldsymbol{P}, L)\} \cup \mathcal{P}_{1}^{\prime}\right) \\
\xrightarrow{\bar{a}\langle c\rangle} B_{1} & =\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, S \sigma_{1} \cup S_{1}, \mathcal{P} \sigma_{1} \cup\{(\boldsymbol{P}, L)\} \cup \mathcal{P}_{1}^{\prime}\right)
\end{aligned}
$$

Then $A_{1}$ can perform the output action and

$$
A_{1}=\nu \widetilde{n}_{1} \cdot\left(\sigma_{1}, S_{1}, \mathcal{P}_{1}^{\prime} \cup\{(\overline{\boldsymbol{a}}\langle\boldsymbol{c}\rangle . \boldsymbol{P}, L)\}\right) \xrightarrow{\bar{a}\langle c\rangle} A_{1}^{\prime}=\nu \widetilde{n}_{1} \cdot\left(\sigma_{1}, S_{1}, \mathcal{P}_{1}^{\prime} \cup\{(\boldsymbol{P}, L)\}\right)
$$

and $\mathcal{C}\left[A_{1}^{\prime}\right]=B_{1}$. From $A_{1} \approx_{l} A_{2}$, there exists $A_{2}^{\prime}$ such that $A_{2} \stackrel{\bar{a}\langle c\rangle}{\Longrightarrow} A_{2}^{\prime} \approx_{l} A_{1}^{\prime}$. Using Corollary 7 we obtain $\mathcal{C}\left[A_{2}\right] \stackrel{\bar{a}\langle c\rangle}{\Longrightarrow} \mathcal{C}\left[A_{2}^{\prime}\right]$. Let $B_{2}=\mathcal{C}\left[A_{2}^{\prime}\right]$. We know that $\left(B_{1}, B_{2}\right) \in \mathcal{R}$.
5. Assume

$$
\mathcal{C}\left[A_{1}\right]=\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, S \sigma_{1} \cup S_{1}, \mathcal{P} \sigma_{1} \cup \mathcal{P}_{1}\right) \xrightarrow{a(M)} B_{1}
$$

where $\operatorname{name}(a, M) \cap\left(\widetilde{n} \cup \widetilde{n}_{1}\right)=\emptyset$ and $f v(M) \subseteq \operatorname{dom}\left(\sigma, \sigma_{1}\right)$.
The input action is defined either in $\mathcal{P}$ in the context part or in $\mathcal{P}_{1}$ in the process part.
(a) Assume the input action is defined in the context part, i.e., $\mathcal{P}=\mathcal{P}^{\prime} \cup\{(a(z) . P, L)\}$ for some $\mathcal{P}^{\prime}, P, L$ and $z \notin f v\left(A_{1}, A_{2}, \mathcal{C}\right)$.

$$
\begin{aligned}
& \mathcal{C}\left[A_{1}\right]=\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, S \sigma_{1} \cup S_{1}, \mathcal{P}^{\prime} \sigma_{1} \cup\left\{\left(\boldsymbol{a}(\boldsymbol{z}) \cdot \boldsymbol{P} \boldsymbol{\sigma}_{\mathbf{1}}, L\right)\right\} \cup \mathcal{P}_{1}\right) \\
& \xrightarrow{a(M)} B_{1} \\
& \left.=\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, S \sigma_{1} \cup S_{1}, \mathcal{P}^{\prime} \sigma_{1} \cup\left\{\left(\boldsymbol{P} \boldsymbol{\sigma}_{\mathbf{1}}\left\{\boldsymbol{M}\left(\boldsymbol{\sigma} \sigma_{1} \cup \boldsymbol{\sigma}_{\mathbf{1}}\right) / \boldsymbol{z}\right\}, L\right)\right\} \cup \mathcal{P}_{1}\right)\right) \\
& =\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, S \sigma_{1} \cup S_{1}, \mathcal{P}^{\prime} \sigma_{1} \cup\left\{\left((\boldsymbol{P}\{\boldsymbol{M} \boldsymbol{\sigma} / \boldsymbol{z}\}) \boldsymbol{\sigma}_{\mathbf{1}}, L\right)\right\} \cup \mathcal{P}_{1}\right)
\end{aligned}
$$

We construct a new evaluation context $\mathcal{C}^{\prime}=\nu \widetilde{n} .\left(\sigma, S, \mathcal{P}^{\prime} \cup\{(P\{M \sigma / z\}, L)\}\right)$. We can easily verify that $\mathcal{C}^{\prime}\left[A_{1}\right]=B_{1}$ and $\mathcal{C}\left[A_{2}\right] \xrightarrow{a(M)} \mathcal{C}^{\prime}\left[A_{2}\right]$. Since $\left(A_{1}, A_{2}\right) \in \mathcal{R}$, we have $\left(\mathcal{C}^{\prime}\left[A_{1}\right], \mathcal{C}^{\prime}\left[A_{2}\right]\right) \in \mathcal{R}$.
(b) Assume the input action is defined in the process part, i.e., $\mathcal{P}_{1}=\mathcal{P}_{1}^{\prime} \cup\{(a(z) . P, L)\}$ for some $\mathcal{P}_{1}^{\prime}, P, L$

$$
\begin{aligned}
& \mathcal{C}\left[A_{1}\right]=\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, S \sigma_{1} \cup S_{1}, \mathcal{P} \sigma_{1} \cup\{(\boldsymbol{a}(\boldsymbol{z}) \cdot \boldsymbol{P}, L)\} \cup \mathcal{P}_{1}^{\prime}\right) \\
& \xrightarrow{a(M)} B_{1}= \\
& \left.\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, S \sigma_{1} \cup S_{1}, \mathcal{P} \sigma_{1} \cup\left\{\left(\boldsymbol{P}\left\{\boldsymbol{M}\left(\boldsymbol{\sigma} \sigma_{1} \cup \sigma_{1}\right) / \boldsymbol{z}\right\}, L\right)\right\} \cup \mathcal{P}_{1}^{\prime}\right)\right)
\end{aligned}
$$

Then let $A_{1}$ input $M \sigma$ on channel $a$ and we get

$$
\begin{aligned}
& A_{1}=\nu \widetilde{n}_{1} \cdot\left(\sigma_{1}, S_{1}, \mathcal{P}_{1}^{\prime} \cup\{(\boldsymbol{a}(\boldsymbol{z}) \cdot \boldsymbol{P}, L)\}\right) \\
& \xrightarrow{a(M \sigma)} A_{1}^{\prime}=\nu \widetilde{n}_{1} \cdot\left(\sigma_{1}, S_{1}, \mathcal{P}_{1}^{\prime} \cup\left\{\left(\boldsymbol{P}\left\{(\boldsymbol{M} \boldsymbol{\sigma}) \boldsymbol{\sigma}_{1} / \boldsymbol{z}\right\}, L\right)\right\}\right)
\end{aligned}
$$

Since $f v(M) \subseteq \operatorname{dom}\left(\sigma, \sigma_{1}\right)$ and $\operatorname{dom}(\sigma) \cap \operatorname{dom}\left(\sigma_{1}\right)=\emptyset$, we have $(M \sigma) \sigma_{1}=$ $M\left(\sigma \sigma_{1} \cup \sigma_{1}\right)$. We can further verify that $\mathcal{C}\left[A_{1}^{\prime}\right]=B_{1}$. From $A_{1} \approx_{l} A_{2}$, we know that $A_{2} \stackrel{a(M \sigma)}{\Longrightarrow} A_{2}^{\prime} \approx_{l} A_{1}^{\prime}$. Using Corollary 7 we obtain $\mathcal{C}\left[A_{2}\right] \stackrel{a(M)}{\Longrightarrow} \mathcal{C}\left[A_{2}^{\prime}\right]$. Let $B_{2}=\mathcal{C}\left[A_{2}^{\prime}\right]$. We know that $\left(B_{1}, B_{2}\right) \in \mathcal{R}$.
6. Assume

$$
\mathcal{C}\left[A_{1}\right]=\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, S \sigma_{1} \cup S_{1}, \mathcal{P} \sigma_{1} \cup \mathcal{P}_{1}\right) \xrightarrow{\nu z . \bar{a}\langle z\rangle} B_{1}
$$

The output comes either from $\mathcal{P}$ in the context part or from $\mathcal{P}_{1}$ in the process part.
(a) Assume the output is from the context part and $\mathcal{P}=\mathcal{P}^{\prime} \cup\{(\bar{a}\langle M\rangle . P, L)\}$.

$$
\begin{aligned}
\mathcal{C}\left[A_{1}\right] & =\nu \widetilde{n}, \tilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, S \sigma_{1} \cup S_{1}, \mathcal{P}^{\prime} \sigma_{1} \cup\left\{\left(\overline{\boldsymbol{a}}\left\langle\boldsymbol{M} \boldsymbol{\sigma}_{\mathbf{1}}\right\rangle \cdot \boldsymbol{P} \boldsymbol{\sigma}_{\mathbf{1}}, L\right)\right\} \cup \mathcal{P}_{1}\right) \\
\xrightarrow{\nu z \cdot \bar{a}\langle z\rangle} B_{1} & =\nu \widetilde{n}, \tilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1} \cup\left\{\boldsymbol{M} \boldsymbol{\sigma}_{1} / \boldsymbol{z}\right\}, S \sigma_{1} \cup S_{1}, \mathcal{P}^{\prime} \sigma_{1} \cup\left\{\left(\boldsymbol{P} \boldsymbol{\sigma}_{\mathbf{1}}, L\right)\right\} \cup \mathcal{P}_{1}\right)
\end{aligned}
$$

Since the output comes from context, we can have the following transitions from $\mathcal{C}\left[A_{2}\right]$ :

$$
\begin{aligned}
\mathcal{C}\left[A_{2}\right] & =\nu \widetilde{n}, \widetilde{n}_{2} \cdot\left(\sigma \sigma_{2} \cup \sigma_{2}, S \sigma_{2} \cup S_{2}, \boldsymbol{\mathcal { P }} \boldsymbol{\sigma}_{\mathbf{2}} \cup \mathcal{P}_{2}\right) \\
& \left.=\nu \widetilde{n}, \widetilde{n}_{2} \cdot\left(\sigma \sigma_{2} \cup \sigma_{2}, S \sigma_{2} \cup S_{2}, \mathcal{P}^{\prime} \sigma_{2} \cup\left\{\left(\overline{\boldsymbol{a}}\left\langle\boldsymbol{M} \boldsymbol{\sigma}_{\mathbf{2}}\right\rangle \cdot \boldsymbol{P} \boldsymbol{\sigma}_{\mathbf{2}}, L\right)\right\} \cup \mathcal{P}_{2}\right)\right) \\
\xrightarrow{\nu z \cdot \bar{a}\langle z\rangle} B_{2} & \left.=\nu \widetilde{n}, \widetilde{n}_{2} \cdot\left(\sigma \sigma_{2} \cup \sigma_{2} \cup\left\{\boldsymbol{M} \boldsymbol{\sigma}_{\mathbf{2}} / \boldsymbol{z}\right\}, S \sigma_{2} \cup S_{2}, \mathcal{P}^{\prime} \sigma_{2} \cup\left\{\left(\boldsymbol{P} \boldsymbol{\sigma}_{\mathbf{2}}, L\right)\right\} \cup \mathcal{P}_{2}\right)\right)
\end{aligned}
$$

Let $\mathcal{C}^{\prime}=\nu \widetilde{n} .\left(\sigma \cup\{M / z\}-, S-, \mathcal{P}_{2}^{\prime} \cup\{(P, L)\}-\right)$. Then we can verify that $\mathcal{C}^{\prime}\left[A_{i}\right]=B_{i}$ for $i=1,2$. Since $A_{1} \approx_{l} A_{2}$, we have $\left(B_{1}, B_{2}\right) \in \mathcal{R}$.
(b) Assume $\mathcal{P}_{1}=\mathcal{P}_{1}^{\prime} \cup\{(\bar{a}\langle M\rangle . P, L)\}$ and

$$
\begin{aligned}
\mathcal{C}\left[A_{1}\right] & =\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, S \sigma_{1} \cup S_{1}, \mathcal{P} \sigma_{1} \cup\{(\overline{\boldsymbol{a}}\langle\boldsymbol{M}\rangle \cdot \boldsymbol{P}, L)\} \cup \mathcal{P}_{1}^{\prime}\right) \\
\xrightarrow{\nu z . \bar{a}\langle z\rangle} B_{1} & =\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1} \cup\{\boldsymbol{M} / \boldsymbol{z}\}, S \sigma_{1} \cup S_{1}, \mathcal{P} \sigma_{1} \cup\{(\boldsymbol{P}, L)\} \cup \mathcal{P}_{1}^{\prime}\right)
\end{aligned}
$$

Then $A_{1}$ can perform the output action and

$$
\begin{aligned}
& A_{1}=\nu \widetilde{n}_{1} \cdot\left(\sigma_{1}, S_{1}, \mathcal{P}_{1}^{\prime} \cup\{(\overline{\boldsymbol{a}}\langle\boldsymbol{M}\rangle \cdot \boldsymbol{P}, L)\}\right) \\
& \xrightarrow{\nu z \cdot \bar{a}\langle z\rangle} A_{1}^{\prime}=\nu \widetilde{n}_{1} \cdot\left(\sigma_{1} \cup\{\boldsymbol{M} / \boldsymbol{z}\}, S_{1}, \mathcal{P}_{1}^{\prime} \cup\{(\boldsymbol{P}, L)\}\right)
\end{aligned}
$$

and $\mathcal{C}\left[A_{1}^{\prime}\right]=B_{1}$. From $A_{1} \approx_{l} A_{2}$, there exists $A_{2}^{\prime}$ such that $A_{2} \stackrel{\nu z . \bar{a}\langle z\rangle}{\Longrightarrow} A_{2}^{\prime} \approx_{l} A_{1}^{\prime}$. Using Corollary 7 we obtain $\mathcal{C}\left[A_{2}\right] \stackrel{\nu z . \bar{a}\langle z\rangle}{\Longrightarrow} \mathcal{C}\left[A_{2}^{\prime}\right]$. Let $B_{2}=\mathcal{C}\left[A_{2}^{\prime}\right]$. Hence $\left(B_{1}, B_{2}\right) \in$ $\mathcal{R}$.
7. The other cases are similar.

Next, we shall prove the completeness of labelled bisimilarity:
Proposition 9 (Completeness). On closed extended processes with only private state cells, observational equivalence $\approx$ implies labelled bisimilarity $\approx_{l}$.

Proof. To show $\approx \subseteq \approx_{l}$, we construct the following set $\mathcal{R}$ and prove that $\mathcal{R} \subseteq \approx_{l}$.

$$
\mathcal{R}=\left\{\left(A_{1}, A_{2}\right) \mid \exists \widetilde{a}, \widetilde{b}, \widetilde{c}, \widetilde{y} \text { s.t. } \mathcal{C}\left[A_{1}\right]_{\backslash \widetilde{y}} \approx \mathcal{C}\left[A_{2}\right]_{\backslash \widetilde{y}}\right\}
$$

where $\mathcal{C}=\nu \widetilde{c} .\left(-,-,\left\{\left(\bar{a}_{i}\left\langle y_{i}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J^{-}}\right)$with

- $\widetilde{a}, \widetilde{b}, \widetilde{c}$ are pairwise-distinct channel names;
- $(\widetilde{a} \cup \widetilde{b}) \cap f n\left(A_{1}, A_{2}, \widetilde{c}\right)=\emptyset$;
- $\widetilde{a}=\left\{a_{i}\right\}_{i \in I}$ and $\widetilde{b}=\left\{b_{j}\right\}_{j \in J}$ and $\widetilde{c}=\left\{c_{j}\right\}_{j \in J}$;
- $\widetilde{y} \subseteq \operatorname{dom}\left(A_{1}\right)$ and $\widetilde{y}=\left\{y_{i}\right\}_{i \in I}$.

We will prove $\mathcal{R} \subseteq \approx_{l}$. Note that this is sufficient for proving $\approx \subseteq \approx_{l}$, since if $A_{1} \approx A_{2}$ then $\left(A_{1}, A_{2}\right) \in \mathcal{R}$ (by letting $\widetilde{a}=\widetilde{b}=\widetilde{c}=\widetilde{y}=\emptyset$ ) and from $\mathcal{R} \subseteq \approx_{l}$ we know $A_{1} \approx_{l} A_{2}$. The reason we need to introduce the context $\mathcal{C}$ and remove variables $\widetilde{y}$ is that the labelled transition $\xrightarrow{\nu c . \bar{a}\langle c\rangle}$ makes the bound name $c$ become free and the transition $\xrightarrow{\nu x . \bar{a}\langle x\rangle}$ generates a new substitution for term $M$. These cannot happen in internal transitions $\xrightarrow{\tau}$ when considering observational equivalence. To simulate outputting a bound name and a term, we store their values by output actions $\bar{a}_{i}\left\langle y_{i}\right\rangle$ and $\bar{b}_{j}\left\langle c_{j}\right\rangle$ and remove the corresponding variables $y_{i}$ from the substitution. The attacker can refer to these values by using a corresponding input action $a_{i}(x)$ and $b_{j}(z)$.

To show $\mathcal{R} \subseteq \approx_{l}$, assume $\left(A_{1}, A_{2}\right) \in \mathcal{R}$ because of $\mathcal{C}\left[A_{1}\right]_{\backslash \widetilde{y}} \approx \mathcal{C}\left[A_{2}\right]_{\backslash \widetilde{y}}$ where $\mathcal{C}, \tilde{y}$ are stated as above. We shall prove the static equivalence $A_{1} \approx_{s} A_{2}$, and if $A_{1} \xrightarrow{\alpha} A_{1}^{\prime}$ for some $A_{1}^{\prime}$ then there exists $A_{2}^{\prime}$ such that $A_{2} \xrightarrow{\widehat{\alpha}} A_{2}^{\prime}$ and $\left(A_{1}^{\prime}, A_{2}^{\prime}\right) \in \mathcal{R}$.

1. First we prove that $A_{1}$ and $A_{2}$ are statically equivalent, i.e., $A_{1} \approx_{s} A_{2}$. According to the definition of static equivalence, consider two terms $N_{1}, N_{2}$ with $\operatorname{var}\left(N_{1}, N_{2}\right)$ $\subseteq \operatorname{dom}\left(A_{1}\right)$ and let $A_{k}=\nu \widetilde{n}_{k} \cdot\left(\sigma_{k}, S_{k}, \mathcal{P}_{k}\right)$ with $k=1,2$ for some $\widetilde{n}_{1}, \widetilde{n}_{2}$ which do not occur in $N_{1}, N_{2}$. Assume $N_{1} \sigma_{1}={ }_{\Sigma} N_{2} \sigma_{1}$, we shall prove that $N_{1} \sigma_{2}={ }_{\Sigma} N_{2} \sigma_{2}$. The idea of the proof is to construct a context $\mathcal{C}^{\prime}$ for testing whether $N_{1}=N_{2}$ and then applying this context to $\mathcal{C}\left[A_{1}\right]_{\backslash \widetilde{y}}$ and $\mathcal{C}\left[A_{2}\right]_{\backslash \widetilde{y}}$ to see if they behave in the same way. Although $\widetilde{y}$ are removed in $\mathcal{C}\left[A_{1}\right]_{\widehat{y}}$ and $\mathcal{C}\left[A_{2}\right]_{\widehat{y}}$, the values of $\widetilde{y}$ are actually stored in $\bar{a}_{i}\left\langle y_{i}\right\rangle$ for $i \in I$ in the context $\mathcal{C}$. Hence we can get these values by performing input actions on channel $a_{i}$ with $i \in I$. Selecting a fresh channel name $d$, we first construct the following plain process $P_{c}$ :

$$
P_{c}=a_{1}\left(x_{1}\right) \cdot a_{2}\left(x_{2}\right) \cdot \cdots \cdot a_{|I|}\left(x_{|I|}\right) \cdot \text { if } N_{1}\left\{x_{i} / y_{i}\right\}_{i \in I}=N_{2}\left\{x_{i} / y_{i}\right\}_{i \in I} \text { then } \bar{d}
$$

Then we construct an evaluation context $\mathcal{C}^{\prime}=\left(-,-,\left\{\left(P_{c}, \emptyset\right)\right\}-\right)$ and apply it to $\mathcal{C}\left[A_{1}\right]_{\backslash \widetilde{y}}$ and have

$$
\begin{aligned}
& \mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{1}\right]_{\widehat{\tilde{y}}}\right]= \\
& \left.\nu \widetilde{c}, \widetilde{n}_{1} \cdot\left(\sigma_{1 \backslash \widetilde{\boldsymbol{y}}}, S_{1}, \mathcal{P}_{1} \cup\left\{\left(\overline{\boldsymbol{a}}_{i}\left\langle\boldsymbol{y}_{i} \boldsymbol{\sigma}_{\mathbf{1}}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \cup\left\{\left(\boldsymbol{P}_{\boldsymbol{c}} \boldsymbol{\sigma}_{1 \backslash \tilde{\boldsymbol{y}}}, \emptyset\right)\right\}\right)\right) \\
& \Longrightarrow \nu \widetilde{c}, \widetilde{n}_{1} .\left(\begin{array}{c}
\mathcal{P}_{1} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
\sigma_{1 \backslash \widetilde{y}}, S_{1}, \\
\cup\left\{\left(\begin{array}{l}
\text { if }\left(N_{1} \sigma_{1 \backslash \widetilde{y}}\right)\left\{y_{i} \sigma_{1} / \boldsymbol{y}_{i}\right\}_{i \in I} \\
=\left(N_{\mathbf{2}} \sigma_{1 \backslash \widetilde{y}}\right)\left\{y_{i} \sigma_{1} / \boldsymbol{y}_{i}\right\}_{i \in I}
\end{array} \text { then } \bar{d}, \emptyset\right)\right.
\end{array}\right)
\end{aligned}
$$

It is clear that $\left(N_{1} \sigma_{1 \backslash \tilde{y}}\right)\left\{y_{i} \sigma_{1} / y_{i}\right\}_{i \in I}=N_{1} \sigma_{1}=_{\Sigma} N_{2} \sigma_{1}=\left(N_{2} \sigma_{1 \backslash \widetilde{y}}\right)\left\{y_{i} \sigma_{1} / y_{i}\right\}_{i \in I}$, thus the conditional branch jumps to then and we can see that $\mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{1}\right] \backslash \tilde{y}\right] \Downarrow_{d}$. Since $\mathcal{C}\left[A_{1}\right]_{\overparen{y}} \approx \mathcal{C}\left[A_{2}\right]_{\backslash \widetilde{y}}$ and the equivalence should be closed under any closing evaluation context, it should hold that $\mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{2}\right] \backslash \tilde{y}\right] \Downarrow_{d}$ and that means

$$
\begin{aligned}
& \mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{2}\right]_{\backslash \tilde{y}}\right]= \\
& \quad \nu \widetilde{c}, \widetilde{n}_{2} \cdot\left(\sigma_{2 \backslash \widetilde{y}}, S_{2}, \mathcal{P}_{2} \cup\left\{\left(\overline{\boldsymbol{a}}_{\boldsymbol{i}}\left\langle\boldsymbol{y}_{\boldsymbol{i}} \boldsymbol{\sigma}_{\mathbf{2}}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \cup\left\{\left(\boldsymbol{P}_{\boldsymbol{c}} \boldsymbol{\sigma}_{\mathbf{2}} \backslash \widetilde{\boldsymbol{y}}, \emptyset\right)\right\}\right)
\end{aligned}
$$

$$
\begin{aligned}
& \Longrightarrow \\
& \nu \widetilde{c}, \widetilde{n}_{2}, \widetilde{m}^{\prime} .\left(\begin{array}{c}
\mathcal{P}_{2}^{\prime} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
\sigma_{2 \backslash \widetilde{y}}, S_{2}^{\prime}, \quad \cup\left\{\left(\begin{array}{c}
\text { if }\left(\boldsymbol{N}_{\mathbf{1}} \boldsymbol{\sigma}_{\mathbf{2} \backslash \widetilde{\boldsymbol{y}}}\right)\left\{\boldsymbol{y}_{\boldsymbol{i}} \boldsymbol{\sigma}_{\mathbf{2}} / \boldsymbol{y}_{\boldsymbol{i}}\right\}_{\boldsymbol{i} \in \boldsymbol{I}} \\
=\left(\boldsymbol{N}_{\mathbf{2}} \boldsymbol{\sigma}_{\mathbf{2} \backslash \widetilde{\boldsymbol{y}}}\right)\left\{\boldsymbol{y}_{\boldsymbol{i}} \boldsymbol{\sigma}_{\mathbf{2}} / \boldsymbol{y}_{\boldsymbol{i}}\right\}_{i \in \boldsymbol{I}} \text { then } \overline{\boldsymbol{d}}
\end{array}, \emptyset\right)\right. \\
\\
\Longrightarrow \nu \widetilde{c}, \widetilde{n}_{2}, \widetilde{m}^{\prime \prime} .\left(\sigma_{2 \backslash \widetilde{y}}, S_{2}^{\prime \prime}, \mathcal{P}_{2}^{\prime \prime} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \cup\{(\overline{\boldsymbol{d}}, \emptyset)\}\right)
\end{array}\right)
\end{aligned}
$$

This requires $\left(N_{1} \sigma_{2 \backslash \widetilde{y}}\right)\left\{y_{i} \sigma_{2} / y_{i}\right\}_{i \in I}={ }_{\Sigma}\left(N_{2} \sigma_{2 \backslash \widetilde{y}}\right)\left\{y_{i} \sigma_{2} / y_{i}\right\}_{i \in I}$. From $N_{k} \sigma_{2}=$ $\left(N_{k} \sigma_{2 \backslash \tilde{y}}\right)\left\{y_{i} \sigma_{2} / y_{i}\right\}_{i \in I}$ for $k=1$, 2, we have $N_{1} \sigma_{2}=_{\Sigma} N_{2} \sigma_{2}$. Hence $A_{1} \approx_{s} A_{2}$.
2. Now we proceed to show the behavioural equivalence between $A_{1}$ and $A_{2}$. Assume $A_{1} \xrightarrow{\alpha} A_{1}^{\prime}$ for some $A_{1}^{\prime}$ then there exists $A_{2}^{\prime}$ such that $A_{2} \xrightarrow{\widehat{\alpha}} A_{2}^{\prime}$ and $\left(A_{1}^{\prime}, A_{2}^{\prime}\right) \in \mathcal{R}$.
(a) Assume $A_{1}=\nu \widetilde{n}_{1} \cdot\left(\sigma_{1}, S_{1}, \mathcal{P}_{1}\right) \xrightarrow{\tau} A_{1}^{\prime}=\nu \widetilde{n}_{1}^{\prime} \cdot\left(\sigma_{1}, S_{1}^{\prime}, \mathcal{P}_{1}^{\prime}\right)$ for some $\widetilde{n}_{1}^{\prime}, S_{1}^{\prime}, \mathcal{P}_{1}^{\prime}$. Using Corollary 7 , we have

$$
\begin{aligned}
& \mathcal{C}\left[A_{1}\right]_{\backslash \widetilde{y}}=\nu \widetilde{c}, \widetilde{n}_{1} \cdot\left(\sigma_{1 \backslash \widetilde{y}}, S_{1}, \mathcal{P}_{1} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{1}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J}\right) \\
& \quad \xrightarrow{\tau} \mathcal{C}\left[A_{1}^{\prime}\right]_{\backslash \widetilde{y}}=\nu \widetilde{c}, \widetilde{n}_{1}^{\prime} \cdot\left(\sigma_{1 \backslash \widetilde{y}}, S_{1}^{\prime}, \mathcal{P}_{1}^{\prime} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{1}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J}\right)
\end{aligned}
$$

Since $\mathcal{C}\left[A_{1}\right]_{\backslash \tilde{y}} \approx \mathcal{C}\left[A_{2}\right]_{\overparen{y}}$, there exists $B$ such that $\mathcal{C}\left[A_{2}\right]_{\backslash \widetilde{y}} \Longrightarrow B \approx \mathcal{C}\left[A_{1}^{\prime}\right]_{\backslash \tilde{y}}$. Since $\mathcal{C}\left[A_{1}^{\prime}\right]_{\overparen{y}} \Downarrow_{a_{i}, b_{j}}$, it has to be $B \Downarrow_{a_{i}, b_{j}}$. Since $a_{i}, b_{j}$ do not occur in $A_{1}, A_{2}$, these outputs $\bar{a}_{i}\left\langle y_{i}\right\rangle, \bar{b}_{j}\left\langle c_{j}\right\rangle$ are not involved in the transitions $\mathcal{C}\left[A_{2}\right]_{\widehat{y}} \Longrightarrow B$. Thus the only possibility for $B$ is that $B=\nu \widetilde{c}, \widetilde{n}_{2}^{\prime} \cdot\left(\sigma_{2 \backslash \widetilde{y}}, S_{2}^{\prime}, \mathcal{P}_{2}^{\prime} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{2}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J}\right)$ for some $\widetilde{n}_{2}^{\prime}, S_{2}^{\prime}, \mathcal{P}_{2}^{\prime}$. Let $A_{2}^{\prime}=\nu \widetilde{n}_{2}, \widetilde{n}_{2}^{\prime} .\left(\sigma_{2}, S_{2}^{\prime}, \mathcal{P}_{2}^{\prime}\right)$, then $A_{2} \Longrightarrow A_{2}^{\prime}$ and $\mathcal{C}\left[A_{2}^{\prime}\right]_{\widetilde{y}}=$ $B$. From $\mathcal{C}\left[A_{1}^{\prime}\right]_{\backslash \widetilde{y}} \approx \mathcal{C}\left[A_{2}^{\prime}\right]_{\backslash \widetilde{y}}$, we have $\left(A_{1}^{\prime}, A_{2}^{\prime}\right) \in \mathcal{R}$.
(b) Assume $A_{1}=\nu \widetilde{n}_{1} \cdot\left(\sigma_{1}, S_{1}, \mathcal{P}_{1}^{\prime} \cup\{(\bar{a}\langle e\rangle . P, L)\}\right) \xrightarrow{\bar{a}\langle e\rangle} A_{1}^{\prime}=\nu \widetilde{n}_{1} \cdot\left(\sigma_{1}, S_{1}, \mathcal{P}_{1}^{\prime} \cup\right.$ $\{(P, L)\})$ when $a, e \notin \widetilde{n}$. The proof is divided into four cases, according to whether $a, e$ occur in $\widetilde{c}$. If $a, e$ are free names, they can be used directly. But if $a, e$ are bounded by $\widetilde{c}$, we cannot directly refer to them. But the names in $\widetilde{c}$ are stored in the output actions $\bar{b}_{j}\left\langle c_{j}\right\rangle$ for $j \in J$. Hence we can get these bound names by using an additional input action on $b_{j}$ in the context.
i. We start by analysing the simplest case when $a, e \notin \widetilde{c}$. In this case, we can directly use $a, e$ in the context. Let $\mathcal{C}^{\prime}=(-,-,\{(\bar{d}, \emptyset)\} \cup\{(a(x)$.if $x=e$ then $d, \emptyset)\}-)$, where $d$ is fresh. Applying $\mathcal{C}^{\prime}$ to $\mathcal{C}\left[A_{1}\right]_{\widehat{y}}$, we can see that

$$
\begin{aligned}
& \mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{1}\right]_{\backslash \widetilde{y}}\right] \\
& =\nu \widetilde{c}, \tilde{n}_{1} \cdot\left(\begin{array}{rl}
\sigma_{1}, S_{1}, \quad & \left.\cup\left(\bar{a}_{i}\left\langle y_{i} \sigma_{1}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
\cup\{(\overline{\boldsymbol{a}}\langle\boldsymbol{e}\rangle . \boldsymbol{P}, L)\},(\bar{d}, \emptyset),(\boldsymbol{a}(\boldsymbol{x}) . \text { if } \boldsymbol{x}=\boldsymbol{e} \text { then } \boldsymbol{d}, \emptyset)
\end{array}\right) \\
& \xrightarrow{\tau} \\
& \nu \widetilde{c}, \widetilde{n}_{1} \cdot\left(\sigma_{1}, S_{1}, \quad \mathcal{P}_{1}^{\prime} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{1}\right\rangle, \emptyset\right)\right\}_{i \in I} . \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \cup\{(P, L),(\overline{\boldsymbol{d}}, \emptyset),(\text { if } \boldsymbol{e}=\boldsymbol{e} \text { then } \boldsymbol{d}, \emptyset)\}\right) \\
& \Longrightarrow B_{1}=\nu \widetilde{c}, \widetilde{n}_{1} \cdot\left(\sigma_{1}, S_{1}, \mathcal{P}_{1}^{\prime} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{1}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \cup\{(P, L)\}\right)
\end{aligned}
$$

Since $\mathcal{C}\left[A_{1}\right]_{\backslash \widetilde{y}} \approx \mathcal{C}\left[A_{2}\right]_{\backslash \widetilde{y}}$ and $\approx$ is closed under evaluation contexts, we know that $\mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{1}\right]_{\backslash \widetilde{y}}\right] \approx \mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{2}\right]_{\backslash \widetilde{y}}\right]$. Then there exists $B_{2}$ such that

$$
\mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{2}\right]_{\backslash \widetilde{y}}\right] \Longrightarrow B_{2} \approx B_{1}
$$

For $i \in I, j \in J$, we know that $B_{1} \Downarrow_{a_{i}, b_{j}}$ and $B_{1} \not \psi_{d}$. Thus it should be $B_{2} \Downarrow_{a_{i}, b_{j}}$ and $B_{2} \nVdash_{d}$. Since $a$ is different from $a_{i}, b_{j}$ and $a_{i}, b_{j}$ do not occur in $A_{1}, A_{2}$, the only possibility for the transitions $\mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{2}\right]_{\backslash \tilde{y}}\right] \Longrightarrow B_{2}$ is that

$$
\begin{aligned}
& \mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{2}\right]_{\backslash \widetilde{y}]}=\nu \widetilde{c}, \widetilde{n}_{2} .\left(\sigma_{2}, \boldsymbol{S}_{\mathbf{2}}, \begin{array}{rl}
\mathcal{P}_{\mathbf{2}} & \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{2}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
\cup\{(\bar{d}, \emptyset),(a(x) . \text { if } x=e \text { then } d, \emptyset)\}
\end{array}\right)\right. \\
& \Longrightarrow \nu \widetilde{c}, \widetilde{n}_{2}, \widetilde{m} .\left(\sigma_{2}, \boldsymbol{S}_{\mathbf{2}}^{\prime}, \begin{array}{r}
\mathcal{P}_{\mathbf{2}}^{\prime} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{2}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
\cup\{(\bar{d}, \emptyset),(\boldsymbol{a}(\boldsymbol{x}) . \text { if } \boldsymbol{x}=\boldsymbol{e} \text { then } \boldsymbol{d}, \emptyset)\}
\end{array}\right) \\
& \xrightarrow{\tau} \nu \widetilde{c}, \widetilde{n}_{2}, \widetilde{m} .\left(\sigma_{2}, \boldsymbol{S}_{\mathbf{2}}^{\prime}, \begin{array}{rl}
\mathcal{P}_{\mathbf{2}}^{\prime \prime} & \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{2}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
\cup\{(\bar{d}, \emptyset),(\text { if } \boldsymbol{e}=\boldsymbol{e} \text { then } \boldsymbol{d}, \emptyset)\}
\end{array}\right) \\
& \Longrightarrow \nu \widetilde{c}, \widetilde{n}_{2}, \widetilde{m}^{\prime} .\binom{\sigma_{2}, \boldsymbol{S}_{\mathbf{2}}^{\prime \prime}, \quad \mathcal{P}_{\mathbf{2}}^{\prime \prime \prime} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{2}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J}}{\cup\{(\bar{d}, \emptyset),(\text { if } e=e \text { then } d, \emptyset)\}} \\
& \xrightarrow{\tau} \nu \widetilde{c}, \widetilde{n}_{2}, \widetilde{m}^{\prime} .\left(\sigma_{2}, S_{2}^{\prime \prime \prime}, \begin{array}{c}
\left.\mathcal{P}_{2}^{\prime \prime \prime} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{2}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J}\right) \\
\cup\{(\bar{d}, \emptyset),(\boldsymbol{d}, \emptyset)\}
\end{array}\right. \\
& \Longrightarrow \nu \widetilde{c}, \widetilde{n}_{2}, \widetilde{m}^{\prime \prime} .\left(\begin{array}{rl}
\sigma_{2}, S_{2}^{\prime \prime \prime}, & \mathcal{P}_{2}^{(4)} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{2}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
\cup & \{(\overline{\boldsymbol{d}}, \emptyset),(\boldsymbol{d}, \emptyset)\}
\end{array}\right. \\
& \xrightarrow{\tau} \nu \widetilde{c}, \widetilde{n}_{2}, \widetilde{m}^{\prime \prime} .\left(\sigma_{2}, \boldsymbol{S}_{\mathbf{2}}^{\prime \prime \prime}, \mathcal{P}_{\mathbf{2}}^{(4)} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{2}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J}\right) \\
& \Longrightarrow B_{2}=\nu \widetilde{c}, \widetilde{n}_{2}, \widetilde{m}^{\prime \prime \prime} \cdot\left(\sigma_{2}, \boldsymbol{S}_{\mathbf{2}}^{\mathbf{( 4 )}}, \boldsymbol{\mathcal { P }}_{\mathbf{2}}^{\mathbf{( 5 )}} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{2}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J}\right)
\end{aligned}
$$

Let $A_{2}^{\prime}=\nu \widetilde{n}_{2}, \widetilde{m}^{\prime \prime \prime} \cdot\left(\sigma_{2}, S_{2}^{(4)}, \mathcal{P}_{2}^{(5)}\right)$. We can easily verify that $\mathcal{C}\left[A_{2}^{\prime}\right]_{\widehat{y}}=B_{2}$.
Since the outputs $\bar{a}_{i}\left\langle y_{i}\right\rangle, \bar{b}_{j}\left\langle c_{j}\right\rangle$ are not involved in the transitions, we have

$$
\begin{aligned}
A_{2} & \Longrightarrow \nu \widetilde{n}_{2}, \widetilde{m} \cdot\left(\sigma_{2}, S_{2}^{\prime}, \mathcal{P}_{2}^{\prime}\right) \stackrel{\bar{a}\langle e\rangle}{ } \nu \widetilde{n}_{2}, \widetilde{m} \cdot\left(\sigma_{2}, S_{2}^{\prime}, \mathcal{P}_{2}^{\prime \prime}\right) \Longrightarrow \nu \widetilde{n}_{2}, \widetilde{m}^{\prime} \cdot\left(\sigma_{2}, S_{2}^{\prime \prime}, \mathcal{P}_{2}^{(3)}\right) \\
& \Longrightarrow \nu \widetilde{n}_{2}, \widetilde{m}^{\prime \prime} \cdot\left(\sigma_{2}, S_{2}^{(3)}, \mathcal{P}_{2}^{(4)}\right) \Longrightarrow A_{2}^{\prime}=\nu \widetilde{n}_{2}, \widetilde{m}^{\prime \prime \prime} \cdot\left(\sigma_{2}, S_{2}^{(4)}, \mathcal{P}_{2}^{(5)}\right)
\end{aligned}
$$

Hence $A_{1} \xrightarrow{\bar{a}\langle e\rangle} A_{1}^{\prime}, A_{2} \stackrel{\bar{a}\langle e\rangle}{\Longrightarrow} A_{2}^{\prime}$ and $\mathcal{C}\left[A_{1}^{\prime}\right]_{\widehat{y}} \approx \mathcal{C}\left[A_{2}^{\prime}\right]_{\backslash \widetilde{y}}$. Then $\left(A_{1}^{\prime}, A_{2}^{\prime}\right) \in \mathcal{R}$.
ii. If $a=c_{k}$ for some $k \in J$ and $e \notin \widetilde{c}$, let

$$
\mathcal{C}^{\prime}=\left(-,-,\left\{(\bar{d}, \emptyset),\left(b_{k}(u) \cdot u(x) . \text { if } x=e \text { then } d . \bar{b}_{k}\langle u\rangle, \emptyset\right)\right\}-\right)
$$

where $d$ is fresh. Note that each time we consume a $\bar{b}_{j}\langle u\rangle$, we need to generate a
new one since we require each name in $\widetilde{c}$ has an output action.

$$
\begin{aligned}
& \mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{1}\right]_{\backslash \widetilde{y}}\right]= \\
& \left.\begin{array}{l}
\nu \widetilde{c}, \widetilde{n}_{1} \cdot\left(\sigma_{1}, S_{1},\right. \\
\mathcal{P}_{1}^{\prime} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{1}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\overline{\boldsymbol{b}}_{\boldsymbol{j}}\left\langle\boldsymbol{c}_{\boldsymbol{j}}\right\rangle, \emptyset\right)\right\}_{j \in J} \cup\{(\bar{a}\langle e\rangle . P, L),(\bar{d}, \emptyset)\} \\
\stackrel{\tau}{\longrightarrow} \\
\cup\left\{\left(\boldsymbol{b}_{\boldsymbol{k}}(\boldsymbol{u}) \cdot \boldsymbol{u}(\boldsymbol{x}) . \text { if } \boldsymbol{x}=\boldsymbol{e} \text { then } \boldsymbol{d} \cdot \overline{\boldsymbol{b}}_{\boldsymbol{k}}\langle\boldsymbol{u}\rangle, \emptyset\right)\right\}
\end{array}\right) \\
& \left.\begin{array}{l}
\nu \widetilde{\boldsymbol{c}}, \widetilde{n}_{1} \cdot\left(\sigma_{1}, S_{1}, \quad \mathcal{P}_{1}^{\prime} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{1}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\overline{\boldsymbol{b}}_{\boldsymbol{j}}\left\langle\boldsymbol{c}_{\boldsymbol{j}}\right\rangle, \emptyset\right)\right\}_{\boldsymbol{j} \in \boldsymbol{J} \backslash \boldsymbol{k}}\right. \\
\longrightarrow\{(\overline{\boldsymbol{a}}\langle\boldsymbol{e}\rangle . \boldsymbol{P}, L),(\bar{d}, \emptyset)\} \cup\left\{\left(\boldsymbol{a}(\boldsymbol{x}) . \text { if } \boldsymbol{x}=\boldsymbol{e} \text { then } \boldsymbol{d} . \overline{\boldsymbol{b}}_{\boldsymbol{k}}\langle\boldsymbol{a}\rangle, \emptyset\right)\right\}
\end{array}\right) \\
& \Longrightarrow B_{1}=\nu \widetilde{\boldsymbol{c}}, \widetilde{n}_{1} \cdot\left(\sigma_{1}, S_{1}, \mathcal{P}_{1}^{\prime} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{1}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\overline{\boldsymbol{b}}_{\boldsymbol{j}}\left\langle\boldsymbol{c}_{\boldsymbol{j}}\right\rangle, \emptyset\right)_{j \in J}\right\} \cup\{(P, L)\}\right)
\end{aligned}
$$

We can easily verify that $B_{1}=\mathcal{C}\left[A_{1}^{\prime}\right]_{\widehat{y}}$. Since $\mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{1}\right]_{\backslash \widetilde{y}}\right] \approx \mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{2}\right]_{\widehat{y}}\right]$, there exists $B_{2}$ such that

$$
\mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{2}\right]_{\backslash \widetilde{y}}\right] \Longrightarrow B_{2} \approx B_{1}
$$

From $B_{1} \Downarrow_{a_{i}, b_{j}}$ and $B_{1} \not \psi_{d}$, we should also have $B_{2} \Downarrow_{a_{i}, b_{j}}$ and $B_{2} \Downarrow_{d}$. Thus the only possibility for the transitions $\mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{2}\right]_{\widehat{y}}\right] \Longrightarrow B_{2}$ are:

$$
\begin{aligned}
& \mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{2}\right]_{\backslash \widetilde{y}}\right] \\
& =\nu \widetilde{c}, \tilde{n}_{2} .\binom{\left.\sigma_{2}, \boldsymbol{S}_{\mathbf{2}}, \begin{array}{r}
\boldsymbol{P}_{\mathbf{2}}
\end{array} \cup^{\prime}\left(\bar{a}_{i}\left\langle y_{i} \sigma_{2}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \cup\{(\bar{d}, \emptyset)\}}{\cup\left\{\left(b_{k}(u) . u(x) . \text { if } x=e \text { then } d . \bar{b}_{k}\langle u\rangle, \emptyset\right)\right\}} \\
& \Longrightarrow \nu \widetilde{c}, \widetilde{n}_{2}, \widetilde{m} .\left(\sigma_{2}, \boldsymbol{S}_{\mathbf{2}}^{\prime \prime}, \begin{array}{c}

& \Longrightarrow \nu \widetilde{c}, \widetilde{n}_{2}, \widetilde{m}^{\prime \prime} .\binom{\sigma_{2}, \boldsymbol{S}_{2}^{\prime \prime \prime}, \begin{array}{c}
\mathcal{P}_{2}^{(4)}
\end{array} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{2}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J \backslash k}}{\cup\left\{(\bar{d}, \emptyset),\left(\text { if } \boldsymbol{e}=\boldsymbol{e} \text { then } \boldsymbol{d} . \overline{\boldsymbol{b}}_{\boldsymbol{k}}\langle\boldsymbol{a}\rangle, \emptyset\right)\right\}} \\
& \xrightarrow{\tau} \nu \widetilde{c}, \widetilde{n}_{2}, \widetilde{m}^{\prime \prime} .\left(\sigma_{2}, \boldsymbol{S}_{\mathbf{2}}^{\prime \prime \prime}, \mathcal{P}_{\mathbf{2}}^{(4)} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{2}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J \backslash k}\right) \\
& \Longrightarrow \nu \widetilde{c}, \widetilde{n}_{2}, \widetilde{m}^{\prime \prime \prime} .\left(\sigma_{2}, \boldsymbol{S}_{\mathbf{2}}^{(\mathbf{4})}, \begin{array}{rl}
\boldsymbol{P}_{\mathbf{2}}^{(\mathbf{5})} & \left.\cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{2}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J \backslash k}\right) \\
\cup & \left.\cup(\overline{\boldsymbol{d}}, \emptyset),\left(\boldsymbol{d} . \overline{\boldsymbol{b}}_{\boldsymbol{k}}\langle\boldsymbol{a}\rangle, \emptyset\right)\right\}
\end{array}\right. \\
& \xrightarrow{\tau} \nu \widetilde{c}, \widetilde{n}_{2}, \widetilde{m}^{\prime \prime \prime} .\left(\sigma_{2}, \boldsymbol{S}_{\mathbf{2}}^{(\mathbf{4})}, \mathcal{P}_{\mathbf{2}}^{\mathbf{( 5 )}} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{2}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\overline{\boldsymbol{b}}_{\boldsymbol{j}}\left\langle\boldsymbol{c}_{\boldsymbol{j}}\right\rangle, \emptyset\right)\right\}_{\boldsymbol{j} \in J}\right) \\
& \Longrightarrow B_{2}=\nu \widetilde{c}, \tilde{n}_{2}, \widetilde{m}^{(4)} \cdot\left(\sigma_{2}, \boldsymbol{S}_{\mathbf{2}}^{(\mathbf{5})}, \mathcal{P}_{\mathbf{2}}^{(\mathbf{6})} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{2}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J}\right)
\end{aligned}
$$

Let $A_{2}^{\prime}=\nu \widetilde{n}_{2}, \widetilde{m}^{(4)} .\left(\sigma_{2}, S_{2}^{(5)}, \mathcal{P}_{2}^{(6)}\right)$. We can easily verify that $\mathcal{C}\left[A_{2}^{\prime}\right]_{\backslash \widetilde{y}}=B_{2}$. And we have the following transitions from $A_{2}$ to $A_{2}^{\prime}$ :

$$
\begin{aligned}
A_{2} & \Longrightarrow \nu \widetilde{n}_{2}, \widetilde{m} \cdot\left(\sigma_{2}, S_{2}^{\prime}, \mathcal{P}_{2}^{\prime}\right) \Longrightarrow \nu \widetilde{n}_{2}, \widetilde{m}^{\prime} \cdot\left(\sigma_{2}, S_{2}^{\prime \prime}, \mathcal{P}_{2}^{\prime \prime}\right) \\
& \xrightarrow{\bar{a}\langle e\rangle} \nu \widetilde{n}_{2}, \widetilde{m}^{\prime} \cdot\left(\sigma_{2}, S_{2}^{\prime \prime}, \mathcal{P}_{2}^{\prime \prime \prime}\right) \Longrightarrow \nu \widetilde{n}_{2}, \widetilde{m}^{\prime \prime} \cdot\left(\sigma_{2}, S_{2}^{\prime \prime \prime}, \mathcal{P}_{2}^{(4)}\right) \\
& \Longrightarrow \nu \widetilde{n}_{2}, \widetilde{m}^{\prime \prime \prime} \cdot\left(\sigma_{2}, S_{2}^{(4)}, \mathcal{P}_{2}^{(5)}\right) \Longrightarrow A_{2}^{\prime}=\nu \widetilde{n}_{2}, \widetilde{m}^{(4)} \cdot\left(\sigma_{2}, S_{2}^{(5)}, \mathcal{P}_{2}^{(6)}\right)
\end{aligned}
$$

Hence $A_{1} \xrightarrow{\bar{a}\langle e\rangle} A_{1}^{\prime}, A_{2} \xrightarrow{\bar{a}\langle e\rangle} A_{2}^{\prime}$ and $\mathcal{C}\left[A_{1}^{\prime}\right]_{\backslash \widetilde{y}} \approx \mathcal{C}\left[A_{2}^{\prime}\right]_{\backslash \widetilde{y}}$. Then $\left(A_{1}^{\prime}, A_{2}^{\prime}\right) \in \mathcal{R}$. iii. If $e=c_{k}$ with $k \in J$ and $a \notin \widetilde{c}$, let

$$
\mathcal{C}^{\prime}=\left(-,-,\left\{(\bar{d}, \emptyset),\left(b_{k}(v) \cdot a(x) \cdot \text { if } x=v \text { then } d \cdot \bar{b}_{k}\langle v\rangle, \emptyset\right)\right\}-\right)
$$

where $d$ is fresh. The rest of analysis is similar as above.
iv. If $a=e=c_{k}$ with $k \in J$, let

$$
\mathcal{C}^{\prime}=\left(-,-,\left\{(\bar{d}, \emptyset),\left(b_{k}(u) \cdot u(x) . \text { if } x=u \text { then } d \cdot \bar{b}_{k}\langle u\rangle, \emptyset\right)\right\}-\right)
$$

where $d$ is fresh. The rest of analysis is similar as above.
v. If $a=c_{j}$ and $e=c_{k}$ with $j \neq k$ and $j, k \in J$, let

$$
\mathcal{C}^{\prime}=\left(-,-,\left\{(\bar{d}, \emptyset),\left(b_{j}(u) \cdot b_{k}(v) \cdot u(x) . \text { if } x=v \text { then }\left(d \cdot \bar{b}_{j}\langle u\rangle \mid \bar{b}_{k}\langle v\rangle\right), \emptyset\right)\right\}-\right)
$$

where $d$ is fresh. The rest of analysis is similar as above.
(c) $\alpha$ is a base input $a(M)$. Assume $A_{1}=\nu \widetilde{n}_{1} \cdot\left(\sigma_{1}, S_{1}, \mathcal{P}_{1}^{\prime} \cup\{(a(x) \cdot P, L)\}\right) \xrightarrow{a(M)}$ $A_{1}^{\prime}=\nu \widetilde{n}_{1} \cdot\left(\sigma_{1}, S_{1}, \mathcal{P}_{1}^{\prime} \cup\left\{\left(P\left\{M \sigma_{1} / x\right\}, L\right)\right\}\right)$ and $f v(M) \subseteq \operatorname{dom}\left(\sigma_{1}\right)$.
i. If $a \notin \widetilde{c}$, let $\pi:=a_{1}\left(x_{1}\right) \cdot a_{2}\left(x_{2}\right) \cdots \cdot a_{|I|}\left(x_{|I|}\right)$ and consider the evaluation context

$$
\mathcal{C}^{\prime}=\left(-,-,\left\{\left(\prod_{i \in I} \bar{d}_{i}, \emptyset\right),\left(\pi \cdot \bar{a}\left\langle M\left\{x_{i} / y_{i}\right\}_{i \in I}\right\rangle \cdot\left(\prod_{i \in I} d_{i} \cdot \bar{a}_{i}\left\langle x_{i}\right\rangle\right), \emptyset\right)\right\}-\right)
$$

where $\left\{d_{i}\right\}_{i \in I}$ are fresh. Note that the use of $d_{i}$ is to make sure $\left(\prod_{i \in I} d_{i} \cdot \bar{a}_{i}\left\langle x_{i}\right\rangle, \emptyset\right)$ will be split into $\left\{\left(\bar{a}_{i}\left\langle x_{i}\right\rangle, \emptyset\right)\right\}_{i \in I}$. Applying $\mathcal{C}^{\prime}$ to $\mathcal{C}\left[A_{1}\right]_{\overparen{y}}$, we can see that

$$
\begin{aligned}
\mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{1}\right]_{\backslash \tilde{y}}\right] & \Longrightarrow \\
& B_{1}:=\nu \widetilde{c}, \widetilde{n}_{1} \cdot\left(\begin{array}{c}
\sigma_{1}, S_{1}, \\
\mathcal{P}_{1}^{\prime} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{1}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
\cup\left\{\left(P\left\{M \sigma_{1} / x\right\}, L\right)\right\}
\end{array}\right.
\end{aligned}
$$

We can verify that $\mathcal{C}\left[A_{1}^{\prime}\right]_{\backslash \widetilde{y}}=B_{1}$. Similarly we have $\mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{1}\right]_{\backslash \widetilde{y}}\right] \approx \mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{2}\right]_{\backslash \widetilde{y}}\right]$.
Then there exists $B_{2}$ such that

$$
\mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{2}\right]_{\backslash \widetilde{y}}\right] \Longrightarrow B_{2} \approx B_{1}
$$

Since $\mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{1}\right]_{\widehat{y}]} \Downarrow_{a_{i}, b_{j}, d_{i}}\right.$ and $B_{1} \Downarrow_{a_{i}, b_{j}}$ but $B_{1} \not \Downarrow_{d_{i}}$, it should be that $B_{2} \Downarrow_{a_{i}, b_{j}}$ but $B_{2} \not d_{i}$. Hence the only possibility of $\mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{2}\right]_{\widehat{y}}\right] \Longrightarrow B_{2}$ is that

$$
\begin{aligned}
& \mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{2}\right]_{\backslash \widetilde{y}]}\right] \\
& =\nu \widetilde{c}, \widetilde{n}_{2} \cdot\binom{\mathcal{P}_{2} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{2}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J}}{\sigma_{2}, S_{2}, \quad \cup\left\{\left(\prod_{i \in I} \bar{d}_{i}, \emptyset\right),\left(\pi \cdot \bar{a}\left\langle M\left\{x_{i} / y_{i}\right\}_{i \in I}\right\rangle \cdot \prod_{i \in I} d_{i} . \bar{a}_{i}\left\langle x_{i}\right\rangle, \emptyset\right)\right\}} \\
& \Longrightarrow B_{2}:=\nu \widetilde{c}, \widetilde{n}_{2}^{\prime} \cdot\left(\sigma_{2}, S_{2}^{\prime}, \mathcal{P}_{2}^{\prime} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{2}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J}\right)
\end{aligned}
$$

Let $A_{2}^{\prime}=\nu \widetilde{n}_{2}^{\prime} \cdot\left(\sigma_{2}, S_{2}^{\prime}, \mathcal{P}_{2}^{\prime}\right)$. We can easily verify that $\mathcal{C}\left[A_{2}^{\prime}\right]_{\backslash \widetilde{y}}=B_{2}$. Then we have

$$
A_{2}=\nu \widetilde{n}_{2} \cdot\left(\sigma_{2}, S_{2}, \mathcal{P}_{2}\right) \Longrightarrow A_{2}^{\prime}=\nu \widetilde{n}_{2}^{\prime} \cdot\left(\sigma_{2}, S_{2}^{\prime}, \mathcal{P}_{2}^{\prime}\right)
$$

Since $\mathcal{C}\left[A_{1}^{\prime}\right]_{\backslash \widetilde{y}} \approx \mathcal{C}\left[A_{2}^{\prime}\right]_{\backslash \widetilde{y}}$, we have $\left(A_{1}^{\prime}, A_{2}^{\prime}\right) \in \mathcal{R}$.
ii. If $a=c_{j}$ for some $j \in J$, let $\pi:=a_{1}\left(x_{1}\right) \cdot a_{2}\left(x_{2}\right) \cdot \cdots \cdot a_{|I|}\left(x_{|I|}\right)$ and

$$
\mathcal{C}^{\prime}=\left(-,-,\left\{\left(\prod_{i \in I} \bar{d}_{i}, \emptyset\right),\left(\pi \cdot b_{j}(u) \cdot \bar{u}\left\langle M\left\{x_{i} / y_{i}\right\}_{i \in I}\right\rangle \cdot\left(\bar{b}_{j}\langle u\rangle \mid \prod_{i \in I} d_{i} \cdot \bar{a}_{i}\left\langle x_{i}\right\rangle\right), \emptyset\right)\right\}-\right)
$$

where $\left\{d_{i}\right\}_{i \in I}$ are fresh channel names. The analysis is similar as above.
(d) $\alpha$ is an input $a(e)$ of channel name $e$. We require that $a_{i}, b_{j} \notin f n\left(\widetilde{n}_{1}, \widetilde{n}_{2}, \widetilde{c}, A_{1}, A_{2}\right)$. The arbitrary input value $e$ may be one of $a_{i}, b_{j}$ and thus may violate this condition in the subsequent processes. In that case, we can choose a fresh name $d$ to replace $e$ in $\mathcal{C}$ and obtain a new equivalence $\mathcal{C}\{d / e\}\left[A_{1}\right]_{\backslash \widetilde{y}} \approx \mathcal{C}\{d / e\}\left[A_{2}\right]_{\overparen{y}}$. Hence, for simplicity, we can safely assume that no conflict is introduced by $e$. Note that we treat the input of the channel name in a separate case because the channel names are different from base terms. When the input is a base term M, M can contain variables defined in $\sigma$, thus we need to use variables from $\sigma$ when constructing context $C$. But when the input is a channel name, we don't need anything from $\sigma$. Assume $A_{1}=$ $\nu \widetilde{n}_{1} \cdot\left(\sigma_{1}, S_{1}, \mathcal{P}_{1}^{\prime} \cup\{(a(x) . P, L)\}\right) \xrightarrow{a(e)} A_{1}^{\prime}=\nu \widetilde{n}_{1} \cdot\left(\sigma_{1}, S_{1}, \mathcal{P}_{1}^{\prime} \cup\{(P\{e / x\}, L)\}\right)$. Similarly,
i. If $a, e \notin \widetilde{c}$, consider the evaluation context $\mathcal{C}^{\prime}=(-,-,\{(\bar{d}, \emptyset),(\bar{a}\langle e\rangle . d, \emptyset)\}-)$ where $d$ is fresh. Applying $\mathcal{C}^{\prime}$ to $\mathcal{C}\left[A_{1}\right]_{\overparen{y}}$, we can see that

$$
\begin{aligned}
& \mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{1}\right]_{\widehat{y}]}\right] \\
& \quad B_{1}:=\nu \widetilde{c}, \widetilde{n}_{1} \cdot\left(\begin{array}{c}
\sigma_{1}, S_{1}, \begin{array}{c}
\mathcal{P}_{1}^{\prime} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{1}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
\\
\cup\{(P\{e / x\}, L)\}
\end{array}
\end{array}\right)
\end{aligned}
$$

We can verify that $\mathcal{C}\left[A_{1}^{\prime}\right]_{\backslash \widetilde{y}}=B_{1}$. Similarly we have $\mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{1}\right]_{\overparen{y}}\right] \approx \mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{2}\right]_{\backslash \widetilde{y}}\right]$. Then there exists $B_{2}$ such that

$$
\mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{2}\right]_{\backslash \widetilde{y}}\right] \Longrightarrow B_{2} \approx B_{1}
$$

Since $\mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{1}\right]_{\backslash \widetilde{y}}\right] \Downarrow_{a_{i}, b_{j}, d}$ and $B_{1} \Downarrow_{a_{i}, b_{j}}$ but $B_{1} \not \psi_{d}$, it should be that $B_{2} \Downarrow_{a_{i}, b_{j}}$ but $B_{2} \not \psi_{d}$. Hence the only possibility of $\mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{2}\right]_{\backslash \tilde{y}}\right] \Longrightarrow B_{2}$ is that

$$
\begin{aligned}
& \mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{2}\right]_{\backslash \widetilde{y}]}=\nu \widetilde{c}, \widetilde{n}_{2} \cdot\left(\sigma_{2}, S_{2}, \quad \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{2}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J}\right)\right. \\
& \Longrightarrow B_{2}:=\nu \widetilde{c}, \widetilde{n}_{2}^{\prime} \cdot\left(\sigma_{2}, S_{2}^{\prime}, \mathcal{P}_{2}^{\prime} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{2}\right\rangle,(\bar{a}\langle e\rangle . d, \emptyset)\right\}\right.\right. \\
& \left.\Longrightarrow\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J}\right)
\end{aligned}
$$

Let $A_{2}^{\prime}=\nu \widetilde{n}_{2}^{\prime} .\left(\sigma_{2}, S_{2}^{\prime}, \mathcal{P}_{2}^{\prime}\right)$. We can easily verify that $\mathcal{C}\left[A_{2}^{\prime}\right]_{\backslash \widetilde{y}}=B_{2}$. Then we have

$$
A_{2}=\nu \widetilde{n}_{2} \cdot\left(\sigma_{2}, S_{2}, \mathcal{P}_{2}\right) \Longrightarrow A_{2}^{\prime}=\nu \widetilde{n}_{2}^{\prime} \cdot\left(\sigma_{2}, S_{2}^{\prime}, \mathcal{P}_{2}^{\prime}\right)
$$

Since $\mathcal{C}\left[A_{1}^{\prime}\right]_{\backslash \widetilde{y}} \approx \mathcal{C}\left[A_{2}^{\prime}\right]_{\backslash \widetilde{y}}$, we have $\left(A_{1}^{\prime}, A_{2}^{\prime}\right) \in \mathcal{R}$.
ii. If $a=c_{j}$ for some $j \in J$ and $e \notin \widetilde{c}$, consider the evaluation context

$$
\mathcal{C}^{\prime}=\left(-,-,\left\{(\bar{d}, \emptyset),\left(b_{j}(u) \cdot \bar{u}\langle e\rangle \cdot d \cdot \bar{b}_{j}\langle u\rangle, \emptyset\right)\right\}-\right)
$$

where $d$ is fresh. The analysis is similar as above.
iii. If $a=e=c_{k}$ for some $k \in J$, let $\mathcal{C}^{\prime}=\left(-,-,\left\{(\bar{d}, \emptyset),\left(b_{k}(u) \cdot \bar{u}\langle u\rangle . d \cdot \bar{b}_{k}\langle u\rangle, \emptyset\right)\right\}-\right)$ where $d$ is fresh. The analysis is similar as above.
iv. If $a=c_{j}$ and $e=c_{k}$ for some $j, k \in J$ with $j \neq k$, let

$$
\mathcal{C}^{\prime}=\left(-,-,\left\{(\bar{d}, \emptyset),\left(b_{j}(u) \cdot b_{k}(v) \cdot \bar{u}\langle v\rangle .\left(d \cdot \bar{b}_{j}\langle u\rangle \mid \bar{b}_{k}\langle v\rangle\right), \emptyset\right)\right\}-\right)
$$

where $d$ is fresh. The analysis is similar as above.
(e) Assume $A_{1}=\nu \widetilde{n}_{1}^{\prime}, e .\left(\sigma_{1}, S_{1}, \mathcal{P}_{1}^{\prime} \cup\{(\bar{a}\langle e\rangle . P, L)\}\right) \xrightarrow{\nu e . \bar{a}\langle e\rangle} A_{1}^{\prime}=\nu \widetilde{n}_{1}^{\prime} \cdot\left(\sigma_{1}, S_{1}, \mathcal{P}_{1}^{\prime} \cup\right.$ $\{(P, L)\})$ with $e \notin \widetilde{n}_{1}^{\prime}$. In observational equivalence, internal transitions can never make the channel name $e$ free. Thus, we need to construct an evaluation context that is able to provide the information for the names that was output previously. For notational convenience, we write if $x \in V$ then 0 else $P$, where $V=\left\{u_{1}, u_{2}, \cdots, u_{k}\right\}$, for
if $x=u_{1}$ then 0
else if $x=u_{2}$ then 0
......

$$
\text { else if } x=u_{k} \text { then } 0 \text { else } P
$$

i. If $a \notin \widetilde{c}$, consider the evaluation context

$$
\mathcal{C}^{\prime}=\left(-,-,\left\{(\bar{d}, \emptyset),\left(a(x) . \text { if } x \in f n\left(A_{1}, A_{2}\right) \text { then } 0 \text { else } d . \bar{b}_{l}\langle x\rangle, \emptyset\right)\right\}-\right)
$$

with $b_{l}, d$ are fresh, then

$$
\begin{aligned}
& \mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{1}\right]_{\widehat{y}}\right]= \\
& \nu \widetilde{c}, \widetilde{n}_{1}^{\prime}, e .\left(\begin{array}{c}
\mathcal{P}_{1}^{\prime} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{1}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
\sigma_{1 \backslash \widetilde{y}}, S_{1}, \\
\quad \cup\{(\bar{a}\langle e\rangle . P, L)\} \cup\{(\bar{d}, \emptyset)\} \\
\\
\cup\left\{\left(a(x) . \text { if } x \in f n\left(A_{1}, A_{2}\right) \text { then } 0 \text { else } d . \bar{b}_{l}\langle x\rangle, \emptyset\right)\right\}
\end{array}\right)
\end{aligned}
$$

$$
\begin{aligned}
& \Longrightarrow B_{1}= \\
& \nu \widetilde{c}, \widetilde{n}_{1}^{\prime}, e .\left(\begin{array}{c}
\sigma_{1 \backslash \widetilde{y}}, S_{1}, \\
\mathcal{P}_{1}^{\prime} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{1}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
\cup\left\{(P, L),\left(\bar{b}_{l}\langle e\rangle, \emptyset\right)\right\}
\end{array}\right)
\end{aligned}
$$

The output $\bar{b}_{l}\langle e\rangle$ enables $e$ to be accessed by environment through $b_{l}$ in future. Similar to the above analysis, we have $\mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{2}\right]_{\widetilde{y}]} \Longrightarrow B_{2}=\nu \widetilde{c}, \widetilde{n}_{2}^{\prime}, e, \widetilde{m} \cdot\left(\sigma_{2 \backslash \widetilde{y}}\right.\right.$, $\left.S_{2}^{\prime}, \mathcal{P}_{2}^{\prime} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{2}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \cup\left\{\left(\bar{b}_{l}\langle e\rangle, \emptyset\right)\right\}\right)$ and $B_{1} \approx B_{2}$. And also $A_{2} \stackrel{\nu e . \bar{a}\langle e\rangle}{\Longrightarrow} A_{2}^{\prime}=\nu \widetilde{n}_{2}^{\prime}, \widetilde{m} .\left(\sigma_{2}, S_{2}^{\prime}, \mathcal{P}_{2}^{\prime}\right)$. We construct a new context $\mathcal{C}^{\prime \prime}=\nu \widetilde{c}, e .\left(-,-,\left\{\left(\bar{a}_{i}\left\langle y_{i}\right\rangle, \emptyset\right)\right\}_{i \in I}\right.$
$\left.\cup\left\{\left(\bar{b}_{l}\langle e\rangle, \emptyset\right)\right\} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J^{-}}-\right)$. Then we can verify that $B_{k}=\mathcal{C}^{\prime \prime}\left[A_{k}^{\prime}\right]_{\tilde{y}}$ with $k=1,2$. Hence we know that $\left(A_{1}^{\prime}, A_{2}^{\prime}\right) \in \mathcal{R}$.
ii. if $a=c_{j}, j \in J$, let $\mathcal{C}^{\prime}=\left(-,-,\left\{(\bar{d}, \emptyset),\left(b_{j}(u) \cdot u(x) .\left(d . \bar{b}_{l}\langle x\rangle \mid \bar{b}_{j}\langle u\rangle\right), \emptyset\right)\right\}-\right)$ with $b_{l}, d$ are fresh. The analysis is similar as above.
(f) Assume $A_{1}=\nu \widetilde{n}_{1} \cdot\left(\sigma_{1}, S_{1}, \mathcal{P}_{1}^{\prime} \cup\left\{\left(\bar{a}\left\langle M_{1}\right\rangle \cdot P, L\right)\right\}\right) \xrightarrow{\nu x . \bar{a}\langle x\rangle} A_{1}^{\prime}=\nu \widetilde{n}_{1} \cdot\left(\sigma_{1} \cup\right.$ $\left.\left\{M_{1} / x\right\}, S_{1}, \mathcal{P}_{1}^{\prime} \cup\{(P, L)\}\right)$ with $x \notin f v\left(A_{1}\right)$. In observational equivalence, internal transitions can never make term $M_{1}$ free or generate an substitution for $M_{1}$. Thus, we need to construct an evaluation context that is able to provide the information for the terms that have already been output previously.
i. if $a \notin \widetilde{c}$, consider the evaluation context $\mathcal{C}^{\prime}=\left(-,-,\left\{(\bar{d}, \emptyset),\left(a(x) \cdot d \cdot \bar{a}_{l}\langle x\rangle, \emptyset\right)\right\}-\right)$ with $a_{l}, d$ are fresh, then

$$
\begin{aligned}
& \mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{1}\right] \backslash \widetilde{y}\right]=\nu \widetilde{c}, \widetilde{n}_{1} .\left(\begin{array}{cc}
\sigma_{1 \backslash \widetilde{y}}, S_{1}, & \mathcal{P}_{1}^{\prime} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{1}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
& \cup\left\{\left(\bar{a}\left\langle M_{1}\right\rangle . P, L\right),(\bar{d}, \emptyset),\left(a(x) . d \cdot \bar{a}_{l}\langle x\rangle, \emptyset\right)\right\}
\end{array}\right) \\
& \Longrightarrow B_{1}=\nu \widetilde{c}, \widetilde{n}_{1} .\binom{\sigma_{1 \backslash \tilde{y}}, S_{1}, \begin{array}{c}
\mathcal{P}_{1}^{\prime} \cup
\end{array} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{1}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J}}{\cup\left\{(P, L),\left(\bar{a}_{l}\left\langle M_{1}\right\rangle, \emptyset\right)\right\}}
\end{aligned}
$$

The output $\bar{a}_{l}\langle M\rangle$ makes $M$ to be accessed by environment through $a_{l}$ in future. Similar to the above analysis, we have $\mathcal{C}^{\prime}\left[\mathcal{C}\left[A_{2}\right] \backslash \widetilde{y}\right] \Longrightarrow B_{2}=\nu \widetilde{c}, \widetilde{n_{2}}, \widetilde{m} \cdot\left(\sigma_{2 \backslash \tilde{y}}, S_{2}^{\prime}\right.$, $\left.\mathcal{P}_{2}^{\prime} \cup\left\{\left(\bar{a}_{i}\left\langle y_{i} \sigma_{2}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \cup\left\{\left(\bar{a}_{l}\left\langle M_{2}\right\rangle, \emptyset\right)\right\}\right)$ and $B_{1} \approx B_{2}$.
We can see that $A_{2} \stackrel{\nu x . \bar{a}\langle x\rangle}{\Longrightarrow} A_{2}^{\prime}=\nu \widetilde{n}_{2}, \widetilde{m} .\left(\sigma_{2} \cup\left\{M_{2} / x\right\}, S_{2}^{\prime}, \mathcal{P}_{2}^{\prime}\right)$. Let $\mathcal{C}^{\prime \prime}=$ $\nu \widetilde{c} .\left(-,-,\left\{\left(\bar{a}_{i}\left\langle y_{i}\right\rangle, \emptyset\right)\right\}_{i \in I} \cup\left\{\left(\bar{a}_{l}\langle x\rangle, \emptyset\right)\right\} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J}-\right)$. Then we can verify that $B_{k}=\mathcal{C}^{\prime \prime}\left[A_{k}^{\prime}\right]_{\widetilde{y}, x}$ with $k=1,2$. Hence we know that $\left(A_{1}^{\prime}, A_{2}^{\prime}\right) \in \mathcal{R}$.
ii. if $a=c_{j}, j \in J$, let $\mathcal{C}^{\prime}=\left(-,-,\left\{(\bar{d}, \emptyset),\left(b_{j}(u) \cdot u(x) .\left(d \cdot \bar{a}_{l}\langle x\rangle \mid \bar{b}_{j}\langle u\rangle\right), \emptyset\right)\right\}-\right)$ with $a_{l}, d$ are fresh. The analysis is similar as above.

Theorem 10 (Coincidence). On closed extended processes with only private state cells, it holds that $\approx=\approx_{l}$.

## Proof.

- For any $A \approx_{l} B$, we can easily check $\operatorname{dom}(A)=\operatorname{dom}(B)$ and $A \Downarrow_{a}$ then $B \Downarrow_{a}$. Using Proposition 8 , we know $\mathcal{C}[A] \approx_{l} \mathcal{C}[B]$ for any context $\mathcal{C}$. According to Definition 1 we know $\approx_{l} \subseteq \approx$.

$$
\begin{aligned}
& \lfloor 0\rfloor_{S}=0 \quad\lfloor P \mid Q\rfloor_{S}=\lfloor P\rfloor_{S} \mid\lfloor Q\rfloor_{S} \quad\lfloor\nu n . P\rfloor_{S}=\nu n .\lfloor P\rfloor_{S} \text { if } n \notin \mathcal{N}_{s} \\
& \lfloor!P\rfloor_{S}=!\lfloor P\rfloor_{S} \quad\lfloor u(x) . P\rfloor_{S}=u(x) .\lfloor P\rfloor_{S} \quad\lfloor\bar{u}\langle M\rangle . P\rfloor_{S}=\bar{u}\langle M\rangle .\lfloor P\rfloor_{S} \\
& \lfloor\text { if } M=N \text { then } P \text { else } Q\rfloor_{S}=\text { if } M=N \text { then }\lfloor P\rfloor_{S} \text { else }\lfloor Q\rfloor_{S} \\
& \lfloor s \mapsto M\rfloor_{S}=\overline{c_{s}}\langle M\rangle \quad\lfloor\nu s . P\rfloor_{S}=\nu c_{s} .\lfloor P\rfloor_{S} \text { if } s \in \mathcal{N}_{s} \\
& \lfloor\text { lock } s . P\rfloor_{S}= \begin{cases}c_{s}(x) .\lfloor P\rfloor_{S \cup\{s \mapsto x\}} & \text { if } s \notin \operatorname{dom}(S) \text { and } x \text { is fresh } \\
0 & \text { otherwise }\end{cases} \\
& \lfloor\text { unlock } s . P\rfloor_{S}= \begin{cases}\overline{c_{s}}\langle M\rangle \mid\lfloor P\rfloor_{T} & \text { if } S=T \cup\{s \mapsto M\} \\
0 & \text { otherwise }\end{cases} \\
& \lfloor\text { read } s \text { as } x . P\rfloor_{S}= \begin{cases}\lfloor P\{M / x\}\rfloor_{S} & \text { if } S=T \cup\{s \mapsto M\} \\

& \lfloor s:=M . P\rfloor_{S}= \begin{cases}\lfloor P\rfloor_{T \cup\{s \mapsto M\}} & \text { if } S=T \cup\{s \mapsto N\} \\
c_{s}(x) .\left(\overline{c_{s}}\langle M\rangle \mid\lfloor P\rfloor_{S}\right) & \text { otherwise select fresh variable } x\end{cases}
\end{aligned}
$$

Figure 4: Encoding private state cells with restricted channels

- The other direction $\approx \subseteq \approx_{l}$ is shown in Proposition 9

## 4. Encoding Private State Cells with Restricted Channels

Private state cells can be encoded by restricted channels. This is an important observation; moreover, we will use this to prove Abadi-Fournet's theorem in the following Section 5. However, when modelling security protocols, the drawback of representing private state cells by restricted channels is that it may introduce false attacks when using the automatic tool ProVerif as argued in [8]. The reason is that some features of restricted channels are abstracted away when ProVerif translates process calculus into Horn clauses [15]. To solve this problem, we introduce the primitives for lock, read, write and unlock which will help us design better translations for stateful protocols in ProVerif. This has been demonstrated by the verification of reachability [8], and will be useful in future for verifying observational equivalence.

### 4.1. Encoding Private State Cells

We encode the extended processes with only private state cells into a subset of the extended processes which do not contain any cell name. Since the target language of the encoding does not have any cell name, we abbreviate extended processes $\nu \widetilde{n} .\left(\sigma, \emptyset,\left\{\left(P_{i}, \emptyset\right)\right\}_{i \in I}\right)$ with no cell name to $\nu \widetilde{n} .\left(\sigma,\left\{P_{i}\right\}_{i \in I}\right)$.

First we define encoding $\lfloor P\rfloor_{S}$ in Figure 4 for the plain process $P$ under a given set of state cells $S=\left\{s_{1} \mapsto M_{1}, \ldots, s_{n} \mapsto M_{n}\right\}$. For each cell $s$, we select a fresh channel name $c_{s}$. The encoding in Figure 4 only affects the part related to cell names, leaving other parts like input and output unchanged. The state cell $s \mapsto M$ and unlock $s$ are both encoded by an output $\overline{c_{s}}\langle M\rangle$ on the restricted channel $c_{s}$. The lock $s$ is represented by an input $c_{s}(x)$ on the same channel $c_{s}$. To read the cell read $s$ as $x$,
we use the input $c_{s}(x)$ to get the value from the cell and then put the value back $\overline{c_{s}}\langle x\rangle$, which enables the other operations on cell $s$ in future. To write a new value into the cell $s:=N$, we need to first consume the existing $\overline{c_{s}}\langle M\rangle$ by an input $c_{s}(x)$ and then generate a new output $\overline{c_{s}}\langle N\rangle$. Our encoding ensures that there is only one output $\overline{c_{s}}\langle M\rangle$ available on a specified restricted channel $c_{s}$ at each moment. When the cell is locked, namely $\overline{c_{s}}\langle M\rangle$ is consumed by some $c_{s}(x)$, the other processes that intend to access the cell have to wait until an output $\overline{c_{s}}\langle N\rangle$ is available.

Let $A=\nu \widetilde{s}, \widetilde{n} .\left(\sigma,\left\{s_{i} \mapsto M_{i}\right\}_{i \in I},\left\{\left(P_{j}, L_{j}\right)\right\}_{j \in J}\right)$ be an extended process ${ }^{2}$ where $\widetilde{s} \subset \mathcal{N}_{s}$ and $\widetilde{n} \cap \mathcal{N}_{s}=\emptyset$. We define the encoding $\lfloor A\rfloor$ as:

$$
\lfloor A\rfloor=\nu \widetilde{c_{s}}, \widetilde{n} .\left(\sigma,\left\{\overline{c_{s_{i}}}\left\langle M_{i}\right\rangle\right\}_{i \in U} \cup\left\{\left\lfloor P_{j}\right\rfloor_{S_{j}}\right\}_{j \in J}\right)
$$

where $U=\left\{i \mid s_{i} \notin \bigcup_{j \in J} L_{j}\right.$ and $\left.i \in I\right\}$ and $S_{j}=\left\{s_{i} \mapsto M_{i} \mid s_{i} \in L_{j}\right.$ and $\left.i \in I\right\}$. Intuitively, $U$ is the set of indices of the unlocked state cells in $\left\{s_{i} \mapsto M_{i}\right\}_{i \in I}$, and $S_{j}$ is the set of state cells locked by $L_{j}$.

Example 11. Let $A=\nu s .(\emptyset,\{s \mapsto 0\},\{(T(s), \emptyset)\})$ where $T(s)$ is defined in Example 3. Then $\lfloor A\rfloor=\nu c_{s} .\left(\emptyset,\left\{\overline{c_{s}}\langle 0\rangle,\lfloor T(s)\rfloor_{\emptyset}\right\}\right)$ with $\lfloor T(s)\rfloor_{\emptyset}=c_{s}(z) \cdot \bar{a}\langle g(z)\rangle . \overline{c_{s}}\langle h(z)\rangle$ obtained by:

$$
\begin{aligned}
\lfloor T(s)\rfloor_{\emptyset} & =\lfloor\text { lock } s . \text { read } s \text { as } x \cdot \bar{a}\langle g(x)\rangle \cdot s:=h(x) . \text { unlock } s\rfloor_{\emptyset} \\
& =c_{s}(z) \cdot\lfloor\operatorname{read} s \text { as } x \cdot \bar{a}\langle g(x)\rangle \cdot s:=h(x) . \text { unlock } s\rfloor_{\{s \mapsto z\}} \\
& =c_{s}(z) \cdot\lfloor\bar{a}\langle g(z)\rangle \cdot s:=h(z) \cdot \text { unlock } s\rfloor_{\{s \mapsto z\}} \\
& =c_{s}(z) \cdot \bar{a}\langle g(z)\rangle \cdot\lfloor s:=h(z) \cdot \text { unlock } s\rfloor_{\{s \mapsto z\}} \\
& =c_{s}(z) \cdot \bar{a}\langle g(z)\rangle \cdot\lfloor\text { unlock } s\rfloor_{\{s \mapsto h(z)\}} \\
& =c_{s}(z) \cdot \bar{a}\langle g(z)\rangle \cdot \overline{c_{s}}\langle h(z)\rangle
\end{aligned}
$$

### 4.2. Soundness and Completeness of the Encoding

We call the process $\nu \widetilde{n} .\left(\sigma,\left\{P_{j}\right\}_{j \in J}\right)$ described in Section 4 which does not contain any cell name a pure extended process. The operational semantics for pure extended process is still defined by Figure 1. On closed pure extended processes, the labelled bisimilarity are defined exactly the same as in Definition 5, while the observational equivalence $\approx^{e}$ is defined exactly the same as in Definition 1 except that the evaluation context does not contain any cell name.

We first define another equivalence $\simeq$ on the pure extended process.

## Definition 12. Let $\simeq$ be the smallest equivalence relation on pure extended processes

 closed under $\alpha$-conversion such that$$
\begin{array}{lrl}
\text { I. } & \nu \widetilde{n}, m \cdot(\sigma, \mathcal{P}) & \simeq \nu \widetilde{n} \cdot(\sigma, \mathcal{P}) \quad \text { if } m \notin f n(\widetilde{n}, \sigma, \mathcal{P}) \\
\text { II. } & \nu \widetilde{n} \cdot(\sigma, \mathcal{P} \cup\{\nu m \cdot P\}) & \simeq \nu \widetilde{n}, m \cdot(\sigma, \mathcal{P} \cup\{P\}) \text { if } m \notin \text { fn }(\widetilde{n}, \sigma, \mathcal{P}) \\
I I I . & \nu \widetilde{n} \cdot(\sigma, \mathcal{P} \cup\{P \mid Q\}) & \simeq \nu \widetilde{n} \cdot(\sigma, \mathcal{P} \cup\{P\} \cup\{Q\}) \\
I V . & \nu \widetilde{n} \cdot(\sigma\{M / x\}, \mathcal{P}\{M / x\}) & \simeq \nu \widetilde{n} \cdot(\sigma\{N / x\}, \mathcal{P}\{N / x\}) \text { if } M={ }_{\Sigma} N
\end{array}
$$

[^2]We write $A \simeq^{1} B$ when the rewriting is just one step, i.e., by using one of the above four rules. In the following discussion, when we consider the derivation sequence $A \simeq^{1} A_{1} \simeq^{1} A_{2} \cdots \simeq^{1} A_{n} \simeq^{1} B$ for the closed pure extended processes $A$ and $B$, we can safely assume that $A_{1}, A_{2}, \cdots, A_{n}$ are all closed pure extended processes. The above rule IV may introduce some redundant variables, for example $(\emptyset,\{\bar{a}\langle m\rangle\}) \simeq(\emptyset,\{\bar{a}\langle\operatorname{dec}(\operatorname{enc}(m, x), x)\rangle\})$ introduces a redundant variable $x$ using a symmetric decryption rule $\operatorname{dec}(\operatorname{enc}(z, x), x)=_{\Sigma} z$. This kind of variables are meaningless and we can use an injective renaming $\varrho$ to substitute these redundant variables with fresh names and get a new closed derivation sequence $A \simeq^{1} \varrho\left(A_{1}\right) \simeq^{1} \varrho\left(A_{2}\right) \cdots \simeq^{1}$ $\varrho\left(A_{n}\right) \simeq^{1} B$. These redundant variables introduced by $\simeq$ are all dummy varialbes which are actually useless.

Lemma 13. Let $A, B$ be two closed pure extended processes. If $B \simeq^{1} A \xrightarrow{\alpha} A^{\prime}$ with $f v(\alpha) \subseteq \operatorname{dom}(A)$ then there exists a closed pure extended process $B^{\prime}$ such that either $B \xrightarrow{\widehat{\alpha}} A^{\prime}$ or $B \xrightarrow{\alpha} B^{\prime} \simeq^{1} A^{\prime}$.

Proof. See Appendix B
Corollary 14. Let $A, B$ be two closed pure extended processes. If $B \simeq A \xrightarrow{\alpha} A^{\prime}$ with $f v(\alpha) \subseteq \operatorname{dom}(A)$ then $B \xrightarrow{\widehat{\alpha}} B^{\prime} \simeq A^{\prime}$ for some closed pure extended process $B^{\prime}$.

Proof. Using Lemma 13 several times.
Corollary 15. Assume two closed pure extended processes $A, B$ and $f v(\alpha) \subseteq \operatorname{dom}(A)$. If $B \simeq A \xlongequal{\alpha} A^{\prime}$ then $B \xlongequal{\widehat{\alpha}} B^{\prime} \simeq A^{\prime}$ for some closed pure extended process $B^{\prime}$.

Proof. By repeated applications of Corollary 14 .
Now we start to prove that encoding preserves observational equivalence. Given a set of cells $S=\left\{s_{1} \mapsto M_{1}, \cdots, s_{n} \mapsto M_{n}\right\}$ and a set of locks $L$, we define the projection $\left.S\right|_{L}$ of $S$ under $L$ to be the set $\{t \mapsto N \mid\{t \mapsto N\} \subseteq S$ and $t \in L\}$.

Lemma 16. Let $A$ be a closed extended process and $f v(\alpha) \subseteq \operatorname{dom}(A)$. If $A \xrightarrow{\alpha} B$ then $\lfloor A\rfloor \xlongequal{\widehat{\alpha}}\lfloor B\rfloor$.

Proof. See Appendix B
Corollary 17. Let $A$ be a closed extended process and $f v(\alpha) \subseteq \operatorname{dom}(A)$. If $A \xlongequal{\alpha} B$ then $\lfloor A\rfloor \stackrel{\widehat{\alpha}}{\Longrightarrow}\lfloor B\rfloor$.

Proof. If $A \xrightarrow{\alpha} A^{\prime}$ and $A$ is closed, we can verify that $A^{\prime}$ is also closed. This enables us to use Lemma 16 several times and get the conclusion.

Lemma 18. Let $A$ be a closed extended process and $f v(\alpha) \subseteq \operatorname{dom}(A)$. If $\lfloor A\rfloor \xrightarrow{\alpha} B$ then $A \xlongequal{\widehat{\alpha}} A^{\prime}$ and $\left\lfloor A^{\prime}\right\rfloor \simeq B$ for some $A^{\prime}$.

Proof. We only detail the proof for the communication on channel $c_{s}$ which is obtained by encoding the cell name $s$. The other cases are trivial. Assume $\lfloor A\rfloor=\nu \widetilde{n} .(\sigma, \mathcal{P} \cup$ $\left.\left\{\overline{c_{s}}\langle M\rangle, c_{s}(x) . P\right\}\right) \xrightarrow{\tau} B=\nu \widetilde{n} .(\sigma, \mathcal{P} \cup\{P\{M / x\}\})$. The input $c_{s}(x)$ may be encoded from lock $s$, read $s$ as $x$ or $s:=N$ where $s$ is not locked, and the output may come from $\{s \mapsto M\}$ in plain process or in set of cells. We only detail the proof for the case when $\{s \mapsto M\}$ is already in cells part. The other case is similar.

1. Assume $A=\nu \widetilde{k} .(\sigma, S \cup\{s \mapsto M\}, \mathcal{Q} \cup\{($ lock $s . Q, L)\})$ with $s \notin L$. We have that the encoding of $\widetilde{k}$ is $\widetilde{n}$ while the encoding of $\mathcal{Q}$ and $S$ under locks locks $(\mathcal{Q}) \cup L$ is $\mathcal{P}$. And the encoding $\lfloor\text { lock } s . Q\rfloor_{\left.S\right|_{L}}=c_{s}(x) .\lfloor Q\rfloor_{\left.S\right|_{L} \cup\{s \mapsto x\}}=c_{s}(x) . P$. Thus we have $\lfloor Q\rfloor_{\left.S\right|_{L} \cup\{s \mapsto x\}}=P$. Substitute $x$ with $M$, we get $\lfloor Q\rfloor_{\left.S\right|_{L} \cup\{s \mapsto M\}}=P\{M / x\}$ since $x \notin f v(Q)$. Consider the transition $A \xrightarrow{\tau} A^{\prime}:=\nu \widetilde{k} .(\sigma, S \cup\{s \mapsto M\}, \mathcal{Q} \cup$ $\{(Q, L \cup\{s\})\})$, then we have $\left\lfloor A^{\prime}\right\rfloor=\nu \widetilde{n} .\left(\sigma, \mathcal{P} \cup\left\{\lfloor Q\rfloor_{\left.S\right|_{L} \cup\{s \mapsto M\}}\right\}\right)=\nu \widetilde{n} .(\sigma, \mathcal{P} \cup$ $\{P\{M / x\}\})=B$.
2. Assume $A=\nu \widetilde{k} .(\sigma, S \cup\{s \mapsto M\}, \mathcal{Q} \cup\{(\operatorname{read} s$ as $x . Q, L)\})$ with $s \notin L \cup$ $\operatorname{locks}(\mathcal{Q})$. We have that the encoding of $\widetilde{k}$ is $\widetilde{n}$ while the encoding of $\mathcal{Q}$ and $S$ under locks $\operatorname{locks}(\mathcal{Q}) \cup L$ is $\mathcal{P}$. And the encoding $\lfloor\operatorname{read} s \text { as } x \cdot Q\rfloor_{\left.S\right|_{L}}=c_{s}(x) .\left(\overline{c_{s}}\langle x\rangle \mid\right.$ $\left.\lfloor Q\rfloor_{\left.S\right|_{L}}\right)=c_{s}(x) . P$. Thus we get $\overline{c_{s}}\langle x\rangle \mid\lfloor Q\rfloor_{S_{L}}=P$. Consider the transition $A \xrightarrow{\tau} A^{\prime}=\nu \widetilde{k} .(\sigma, S \cup\{s \mapsto M\}, \mathcal{Q} \cup\{(Q\{M / x\}, L)\})$. Substituting $x$ with $M$, we get $\left(\overline{c_{s}}\langle M\rangle \mid\lfloor Q\{M / x\}\rfloor_{\left.S\right|_{L}}\right)=P\{M / x\}$ since $x \notin f v\left(\left.S\right|_{L}\right)$. Thus we have $\left\lfloor A^{\prime}\right\rfloor=$ $\nu \widetilde{n} .\left(\sigma, \mathcal{P} \cup\left\{\overline{c_{s}}\langle M\rangle,\lfloor Q\{M / x\}\rfloor_{\left.S\right|_{L}}\right\}\right) \simeq \nu \widetilde{n} .\left(\sigma, \mathcal{P} \cup\left\{\overline{c_{s}}\langle M\rangle \mid\lfloor Q\{M / x\}\rfloor_{\left.S\right|_{L}}\right\}\right)=$ $B$.
3. Assume $A=\nu \widetilde{k} .(\sigma, S \cup\{s \mapsto M\}, \mathcal{Q} \cup\{(s:=N . Q, L)\})$ with $s \notin L \cup \operatorname{locks}(\mathcal{Q})$. We have that the encoding of $\widetilde{k}$ is $\widetilde{n}$ while the encoding of $\mathcal{Q}$ and $S$ under locked cells $\operatorname{locks}(\mathcal{Q}) \cup L$ is $\mathcal{P}$. And the encoding $\lfloor s:=N \cdot Q\rfloor_{\left.S\right|_{L}}=c_{s}(x) .\left(\overline{c_{s}}\langle N\rangle \mid\lfloor Q\rfloor_{\left.S\right|_{L}}\right)=$ $c_{s}(x) . P$. Thus we get $\overline{c_{s}}\langle N\rangle \mid\lfloor Q\rfloor_{\left.S\right|_{L}}=P$. Consider the transition $A \xrightarrow{\tau} A^{\prime}=$ $\nu \widetilde{k} .(\sigma, S \cup\{s \mapsto M\}, \mathcal{Q} \cup\{(Q, L)\})$.Thus we have $\left\lfloor A^{\prime}\right\rfloor=\nu \widetilde{n} .\left(\sigma, \mathcal{P} \cup\left\{\overline{c_{s}}\langle N\rangle,\lfloor Q\rfloor_{\left.S\right|_{L}}\right\}\right)$ $\simeq \nu \widetilde{n} .\left(\sigma, \mathcal{P} \cup\left\{\overline{c_{s}}\langle N\rangle \mid\lfloor Q\rfloor_{\left.S\right|_{L}}\right\}\right)=B$.

Corollary 19. Let $A$ be a closed extended process and $\operatorname{fv}(\alpha) \subseteq \operatorname{dom}(A)$. If $\lfloor A\rfloor \stackrel{\alpha}{\Longrightarrow}$ $B$ then $A \xlongequal{\widehat{\alpha}} A^{\prime}$ and $\left\lfloor A^{\prime}\right\rfloor \simeq B$ for some $A^{\prime}$.

Proof. Using Lemma 18 and Corollary 15 several times.
The following theorem states that encoding preserves the observational equivalence:

Theorem 20. For two closed extended processes $A, B$ with only private state cells, we have $A \approx B$ iff $\lfloor A\rfloor \approx^{e}\lfloor B\rfloor$ where $\approx^{e}$ is an equivalence defined exactly the same as Definition $\sqrt{1}$ except the context $\mathcal{C}$ does not contain any cell names.

## Proof.

1. We construct the following set $\mathcal{R}$ on pairs of closed extended processes:

$$
\mathcal{R}=\left\{(A, B) \mid\lfloor A\rfloor \simeq D_{1} \approx^{e} D_{2} \simeq\lfloor B\rfloor\right\}
$$

and prove that $\mathcal{R} \subseteq \approx$.
If $A \Downarrow_{c}$, by Corollary 17 , we have $\lfloor A\rfloor \Downarrow_{c}$. Using Corollary 15 we have $D_{1} \Downarrow_{c}$. Since $D_{1} \approx^{e} D_{2}$, we have $D_{2} \Downarrow_{c}$. Using Corollary 15 , we have $\lfloor B\rfloor \Downarrow_{c}$. By Corollary 19 we know that $B \Downarrow_{c}$.
If $A \Longrightarrow A^{\prime}$, by Corollary 17, we have $\lfloor A\rfloor \Longrightarrow\left\lfloor A^{\prime}\right\rfloor$. From Corollary 15, there exists $D_{1}^{\prime}$ such that $D_{1} \Longrightarrow D_{1}^{\prime} \simeq\left\lfloor A^{\prime}\right\rfloor$. Since $D_{1} \approx^{e} D_{2}$, there exists $D_{2}^{\prime}$ such that $D_{2} \Longrightarrow D_{2}^{\prime} \approx^{e} D_{1}^{\prime}$. By Corollary 15 there exists $D_{2}^{\prime \prime}$ such that $\lfloor B\rfloor \Longrightarrow D_{2}^{\prime \prime} \simeq D_{2}^{\prime}$. By Corollary 19, there exists $B^{\prime}$ such that $B \Longrightarrow B^{\prime}$ and $\left\lfloor B^{\prime}\right\rfloor \simeq D_{2}^{\prime \prime} \simeq D_{2}^{\prime}$. From $A \Longrightarrow A^{\prime}$ and $\left\lfloor A^{\prime}\right\rfloor \simeq D_{1}^{\prime} \approx^{e} D_{2}^{\prime}$, we know that $\left(A^{\prime}, B^{\prime}\right) \in \mathcal{R}$.
For any evaluation context $\mathcal{C}=\nu \widetilde{n} .(\sigma-, S-, \mathcal{P}-)$, we need to prove that $(\mathcal{C}[A], \mathcal{C}[B]) \in$ $\mathcal{R}$. We can use the same encoding to encode away all the cell names in the context $\mathcal{C}$ and get a new evaluation context $\lfloor\mathcal{C}\rfloor=\nu \widetilde{l} .(\sigma-, \mathcal{Q}-)$. Assume $A=\nu \widetilde{n}_{1} \cdot\left(\sigma_{1}, S_{1}, \mathcal{P}_{1}\right)$ and $\lfloor A\rfloor=\nu \widetilde{m}_{1} \cdot\left(\sigma_{1}, \mathcal{Q}_{1}\right)$. Then we can see that $\mathcal{C}[A]=\nu \widetilde{n}, \widetilde{m} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, S \sigma_{1} \cup\right.$ $\left.S_{1}, \mathcal{P} \sigma_{1} \cup \mathcal{P}_{1}\right)$ and $\lfloor\mathcal{C}\rfloor[\lfloor A\rfloor]=\nu \widetilde{l}, \widetilde{m}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1}, \mathcal{Q} \sigma_{1} \cup \mathcal{Q}_{1}\right)$. Note that $\mathcal{C}$ and $A$ do not share any cell name. Applying encoding to $\mathcal{C}[A]$ we get $\lfloor\mathcal{C}[A]\rfloor=\nu \widetilde{l}, \widetilde{m}_{1} \cdot\left(\sigma \sigma_{1} \cup\right.$ $\left.\sigma_{1}, \mathcal{Q} \sigma_{1} \cup \mathcal{Q}_{1}\right)=\lfloor\mathcal{C}\rfloor[\lfloor A\rfloor]$. Similarly we have $\lfloor\mathcal{C}[B]\rfloor=\lfloor\mathcal{C}\rfloor[\lfloor B\rfloor]$. From $\lfloor A\rfloor \simeq D_{1}$ and $D_{2} \simeq\lfloor B\rfloor$, we can see that $\lfloor\mathcal{C}\rfloor[\lfloor A\rfloor] \simeq\lfloor\mathcal{C}\rfloor\left[D_{1}\right]$ and $\lfloor\mathcal{C}\rfloor\left[D_{2}\right] \simeq\lfloor\mathcal{C}\rfloor[\lfloor B\rfloor]$. From $D_{1} \approx^{e} D_{2}$, applying context $\lfloor\mathcal{C}\rfloor$, we can see that $\lfloor\mathcal{C}\rfloor\left[D_{1}\right] \approx^{e}\lfloor\mathcal{C}\rfloor\left[D_{2}\right]$. In brief, we have $\lfloor\mathcal{C}[A]\rfloor=\lfloor\mathcal{C}\rfloor[\lfloor A\rfloor] \simeq\lfloor\mathcal{C}\rfloor\left[D_{1}\right] \approx^{e}\lfloor\mathcal{C}\rfloor\left[D_{2}\right] \simeq\lfloor\mathcal{C}\rfloor[\lfloor B\rfloor]=\lfloor\mathcal{C}[B]\rfloor$. Thus we know $(\mathcal{C}[A], \mathcal{C}[B]) \in \mathcal{R}$.
2. We construct the following set $\mathcal{S}$ on pairs of closed extended processes:

$$
\mathcal{S}=\left\{\left(D_{1}, D_{2}\right) \mid D_{1} \simeq\lfloor A\rfloor, A \approx B,\lfloor B\rfloor \simeq D_{2}\right\}
$$

and prove that $\mathcal{S} \subseteq \approx^{e}$.
If $D_{1} \Downarrow_{c}$, by Corollary 15 , we have $\lfloor A\rfloor \Downarrow_{c}$. Using Corollary 19 we have $A \Downarrow_{c}$. Since $A \approx B$, we have $B \Downarrow_{c}$. By Corollary 17 we know that $\lfloor B\rfloor \Downarrow_{c}$. Using Corollary 15 , we have $D_{2} \Downarrow_{c}$.
If $D_{1} \Longrightarrow D_{1}^{\prime}$, by Corollary 15 , we have $\lfloor A\rfloor \Longrightarrow A_{1}$. From Corollary 19, there exists $A^{\prime}$ such that $A \Longrightarrow A^{\prime}$ and $\left\lfloor A^{\prime}\right\rfloor \simeq A_{1}$. Since $A \approx B$, there exists $B^{\prime}$ such that $B \Longrightarrow B^{\prime} \approx A^{\prime}$. By Corollary 17 , we have $\lfloor B\rfloor \Longrightarrow\left\lfloor B^{\prime}\right\rfloor$. By Corollary 15, there exists $D_{2}^{\prime}$ such that $D_{2} \Longrightarrow D_{2}^{\prime}$ and $\left\lfloor B^{\prime}\right\rfloor \simeq D_{2}^{\prime}$. From $D_{1} \Longrightarrow D_{1}^{\prime}$ and $D_{1}^{\prime} \simeq\left\lfloor A^{\prime}\right\rfloor$, we know that $\left(D_{1}^{\prime}, D_{2}^{\prime}\right) \in \mathcal{R}$.
For any pure evaluation context $\mathcal{C}$, we can easily see that $\mathcal{C}\left[D_{1}\right] \simeq \mathcal{C}[\lfloor A\rfloor]=\lfloor\mathcal{C}[A]\rfloor$ and $\mathcal{C}\left[D_{2}\right] \simeq \mathcal{C}[\lfloor B\rfloor]=\lfloor\mathcal{C}[B]\rfloor$ and $\mathcal{C}[A] \approx \mathcal{C}[B]$, thus $\left(\mathcal{C}\left[D_{1}\right], \mathcal{C}\left[D_{2}\right]\right) \in \mathcal{S}$.

## 5. Proof of Abadi-Fournet's Theorem

We shall use our Theorem 10 and Theorem 20 to derive Abadi-Fournet's theorem, namely Theorem 1 in [3]. We revise the original applied pi calculus [3] slightly: active substitutions are only defined on terms of base sort; otherwise Theorem 1 in [3] does not hold [11] ${ }^{3}$ Since the active substitutions in applied pi calculus float everywhere in the extended processes, in order to prove Abadi-Fournet's theorem, we need to normalise the extended processes first. We can transform the extended processes in the applied pi calculus - denoted by $A_{r}, B_{r}, C_{r}$ to avoid confusion - into the extended processes in stateful applied pi calculus by function $\mathcal{T}$ (assume bound names are pairwise-distinct and different from free names): 4

$$
\begin{aligned}
& \mathcal{T}(0)=(\emptyset, \emptyset) \quad \mathcal{T}(\{M / x\})=(\{M / x\}, \emptyset) \quad \mathcal{T}\left(\nu n . A_{r}\right)=\nu n . \mathcal{T}\left(A_{r}\right) \\
& \mathcal{T}\left(\nu x . A_{r}\right)=\nu \widetilde{n} .(\sigma, \mathcal{P}) \text { if } \mathcal{T}\left(A_{r}\right)=\nu \widetilde{n} .(\sigma \cup\{M / x\}, \mathcal{P}) \\
& \mathcal{T}\left(A_{r}^{1} \mid A_{r}^{2}\right)=\nu \widetilde{n}_{1}, \widetilde{n}_{2} \cdot\left(\left(\sigma_{1} \cup \sigma_{2}\right)^{*},\left(\mathcal{P}_{1} \cup \mathcal{P}_{2}\right)\left(\sigma_{1} \cup \sigma_{2}\right)^{*}\right) \\
& \text { if } \mathcal{T}\left(A_{r}^{i}\right)=\nu \widetilde{n}_{i} \cdot\left(\sigma_{i}, \mathcal{P}_{i}\right) \text { for } i=1,2
\end{aligned}
$$

$\mathcal{T}\left(A_{r}\right)=\left(\emptyset,\left\{A_{r}\right\}\right)$ in all other cases of $A_{r}$
Intuitively, $\mathcal{T}$ pulls out name restrictions, applies active substitutions and separates them from the plain processes, and eliminates variable restrictions. For instance, $\mathcal{T}(\bar{a}\langle x\rangle . \nu n . \bar{a}\langle n\rangle \mid \nu k .\{k / x\})=\nu k .(\{k / x\},\{\bar{a}\langle k\rangle . \nu n . \bar{a}\langle n\rangle\})$. This normalisation $\mathcal{T}$ preserves both observational equivalence and labelled bisimilarity:

Theorem 21 (Soundness and Completeness of Stateful Applied Pi). For two closed extended processes $A_{r}$ and $B_{r}$ in applied pi calculus,

1. $A_{r}$ and $B_{r}$ are labelled bisimilar in applied pi iff $\mathcal{T}\left(A_{r}\right) \approx_{l} \mathcal{T}\left(B_{r}\right)$;
2. $A_{r}$ and $B_{r}$ are observationally equivalent in applied pi iff $\mathcal{T}\left(A_{r}\right) \approx^{e} \mathcal{T}\left(B_{r}\right)$;

Proof. See Appendix C
With all the theorems ready, now we can prove Abadi-Fournet's theorem:
Corollary 22 (Coincidence in Applied Pi). Observational equivalence coincides with labelled bisimilarity in applied pi calculus.

[^3]Proof. This is a direct corollary of Theorem 10. Theorem 20 and Theorem 21
$A_{r}$ and $B_{r}$ are observationally equivalent

```
iff \(\mathcal{T}\left(A_{r}\right) \approx^{e} \mathcal{T}\left(B_{r}\right) \quad\) by Theorem 21(2)
iff \(\mathcal{T}\left(A_{r}\right) \approx \mathcal{T}\left(B_{r}\right) \quad\) by Theorem 20and \(\left\lfloor\mathcal{T}\left(A_{r}\right)\right\rfloor=\mathcal{T}\left(A_{r}\right)\) and \(\left\lfloor\mathcal{T}\left(B_{r}\right)\right\rfloor=\mathcal{T}\left(B_{r}\right)\)
iff \(\mathcal{T}\left(A_{r}\right) \approx_{l} \mathcal{T}\left(B_{r}\right) \quad\) by Theorem 10
iff \(A_{r}\) and \(B_{r}\) are labelled bisimilar by Theorem 21(1)
```

## 6. Extending the Language with Public State Cells

Hardware modules like TPMs and smart cards are intended to be secure, but an attacker might succeed in finding ways of compromising their tamper-resistant features. Similarly, attackers can potentially hack into databases [1]. We model these attacks by considering that the attacker compromises the private state cells, after which they are public. Protocols may provide some security properties that hold even under such compromises of the hardware or database. A typical example is forward privacy [26] which requires the past events remain secure even if the attacker compromises the device. This will be further discussed in the following Example 28 and Example 29 A cell $s$ not in the scope of $\nu s$ is public, which enables the attacker to lock the cell, read its contents or overwrite it.

We now give the details of the syntactic additions for public cells and the definition of observational equivalence. To let a private state cell become public, we extend the plain processes in Section 2 with a new primitive open s.P Extended processes are defined as before. We extend the transitions in Fig. 1 by a new transition relation $\xrightarrow{\tau(s)}$ defined in Fig. 5 for reasoning about public state cells. These internal transitions specify on which public state cell the operations are performed. The label $\tau(s)$ is necessary when we later define labelled bisimilarity. It is worth pointing out that $\tau(s)$ is defined for the read, write and lock operations on a public cell $s$ (the first three rules in Fig. 5p only when the cell is unlocked. When a public cell is locked, the operations on this cell become invisible to the other processes, thus the operations on a locked public cell are defined by internal transitions $\tau$ in Fig. 1. When a public cell $s$ is unlocked, the operations on it are visible, thus are defined by $\tau(s)$ to indicate there is an operation on the cell s.

Let $A=\nu \widetilde{n} .(\sigma, S, \mathcal{P})$ and we write $\operatorname{locks}(A)$ for the set $\operatorname{locks}(\mathcal{P}) \backslash \widetilde{n}$. We write unlocks $(A)$ for the set $f s(A) \backslash \operatorname{locks}(A)$, namely the unlocked public state cells. We write $\stackrel{\epsilon}{\Longrightarrow}$ for the reflexive and transitive closure of $\xrightarrow{\tau}$ and $\xrightarrow{\tau(s)}$ for any cell $s$. We write $A \Downarrow_{a}$ when $A \xlongequal{\epsilon} \nu \widetilde{n} .(\sigma, S, \mathcal{P} \cup\{(\bar{a}\langle M\rangle . P, L)\})$ with $a \notin \widetilde{n}$.

### 6.1. Observational Equivalence

We first define observational equivalence for our stateful language in the presence of public state cells. In principle, we stick to the original definition of observational equivalence [3] as much as possible in order to capture the intuition of indistinguishability from the attacker's point of view.

$$
\begin{aligned}
& \nu \widetilde{n} \cdot(\sigma, S \cup\{s \mapsto M\}, \mathcal{P} \cup\{(\operatorname{read} s \text { as } x . P, L)\}) \quad \xrightarrow{\tau(s)} \quad \nu \widetilde{n} \cdot(\sigma, S \cup\{s \mapsto M\}, \mathcal{P} \cup\{(P\{M / x\}, L)\}) \\
& \text { if } s \notin \widetilde{n} \cup L \cup \operatorname{locks}(\mathcal{P}) \\
& \nu \widetilde{n} .(\sigma, S \cup\{s \mapsto M\}, \mathcal{P} \cup\{(s:=N . P, L)\}) \quad \xrightarrow{\tau(s)} \quad \nu \widetilde{n} .(\sigma, S \cup\{s \mapsto N\}, \mathcal{P} \cup\{(P, L)\}) \\
& \text { if } s \notin \tilde{n} \cup L \cup \operatorname{locks}(\mathcal{P}) \\
& \nu \widetilde{n} .(\sigma, S \cup\{s \mapsto M\}, \mathcal{P} \cup\{(\text { lock } s . P, L)\}) \quad \xrightarrow{\tau(s)} \quad \nu \widetilde{n} .(\sigma, S \cup\{s \mapsto M\}, \mathcal{P} \cup\{(P, L \cup\{s\})\}) \\
& \text { if } s \notin \widetilde{n} \cup L \cup \operatorname{locks}(\mathcal{P}) \\
& \nu \widetilde{n} \cdot(\sigma, S \cup\{s \mapsto M\}, \mathcal{P} \cup\{(\text { unlock } s . P, L)\}) \quad \xrightarrow{\tau(s)} \quad \nu \widetilde{n} \cdot(\sigma, S \cup\{s \mapsto M\}, \mathcal{P} \cup\{(P, L \backslash\{s\})\}) \\
& \text { if } s \notin \widetilde{n} \cup \operatorname{locks}(\mathcal{P}) \text { and } s \in L \\
& \nu \widetilde{n}, s .(\sigma, S \cup\{s \mapsto M\}, \mathcal{P} \cup\{(\text { open } s . P, L)\}) \quad \xrightarrow{\tau(s)} \quad \nu \widetilde{n} .(\sigma, S \cup\{s \mapsto M\}, \mathcal{P} \cup\{(P, L)\}) \\
& \text { if } s \notin \widetilde{n}
\end{aligned}
$$

Figure 5: Internal transitions for public state cells.

Definition 23. Observational equivalence $(\approx)$ is the largest symmetric relation $\mathcal{R}$ on pairs of closed extended processes (which may contain public state cells) such that $A \mathcal{R} B$ implies
(i) $\operatorname{locks}(A)=\operatorname{locks}(B), f s(A)=f s(B)$ and $\operatorname{dom}(A)=\operatorname{dom}(B)$;
(ii) if $A \Downarrow_{a}$ then $B \Downarrow_{a}$;
(iii) if $A \xlongequal{\epsilon} A^{\prime}$ then $B \xlongequal{\epsilon} B^{\prime}$ and $A^{\prime} \mathcal{R} B^{\prime}$ for some $B^{\prime}$;
(iv) for all closing evaluation contexts $\mathcal{C}, \mathcal{C}[A] \mathcal{R} \mathcal{C}[B]$.

The definition of observational equivalence on public state cells is similar to the one for private state cells, but the language features of public state cells are significantly different from private state cells. The addition of public state cells increases the power of the attacker significantly, as without the name restriction $\nu s$ for a state cell $s$, when $s$ is unlocked, the attacker can lock the cell, read its content and overwrite it. To illustrate this point, we start by analysing several examples.

Example 24. The attacker can lock the unlocked public state cells. Assume

$$
A=(\emptyset,\{s \mapsto 0\},\{(\bar{c}\langle b\rangle, \emptyset)\}) \quad B=(\emptyset,\{s \mapsto 0\},\{(\operatorname{read} s \text { as } x . \bar{c}\langle b\rangle, \emptyset)\})
$$

$A$ and $B$ are not observationally equivalent. Let $\mathcal{C}=(-,-,\{(0,\{s\})\}-)$. The context $\mathcal{C}$ does nothing but holds the lock on cell s and it will never release the lock. So we have $\mathcal{C}[A] \Downarrow_{c}$ but $\mathcal{C}[B] \nVdash_{c}$ because reading cell $s$ in $B$ is blocked forever by context $\mathcal{C}$.

In comparison, the following extended processes $A, B$ are observationally equivalent:

$$
\begin{aligned}
& A=(\emptyset,\{s \mapsto 0\},\{(\operatorname{read} s \text { as } x \cdot \bar{c}\langle b\rangle, \emptyset)\}) \\
& B=(\emptyset,\{s \mapsto 0\},\{(\operatorname{read} s \text { as } x \cdot \operatorname{read} s \text { as } y \cdot \bar{c}\langle b\rangle, \emptyset)\})
\end{aligned}
$$

When A performs the reading, $B$ can match it by performing its two reading together. When $B$ performs one reading, $A$ can match it by doing nothing.

Example 25. The attacker can read an unlocked public state cell. Assume

$$
\begin{aligned}
& A=(\emptyset,\{s \mapsto 0\},\{(!s:=0, \emptyset),(!s:=1, \emptyset)\}) \\
& B=(\emptyset,\{s \mapsto 1\},\{(!s:=0, \emptyset),(!s:=1, \emptyset)\})
\end{aligned}
$$

Cell $s$ is unlocked in both $A$ and $B$. Both $A$ and $B$ can write 0 or 1 to the cell $s$ arbitrary number of times. The only difference between $A$ and $B$ is the initial values in cell s. $A$ and $B$ are not observationally equivalent because the context

$$
\mathcal{C}=(-,-,\{(\operatorname{read} s \text { as } x . \text { if } x=0 \text { then } \bar{c}\langle b\rangle,\{s\})\}-)
$$

can distinguish them. The context $\mathcal{C}$ holds the lock of cell $s$, thus no one can change the value in $s$ when $\mathcal{C}$ reads the value. We have $\mathcal{C}[A] \Downarrow_{c}$ but $\mathcal{C}[B] \psi_{c}$.

In comparison, the following processes are observationally equivalent:

$$
\begin{aligned}
& A^{\prime}=(\emptyset,\{s \mapsto 0\},\{(!s:=0, \emptyset),(!s:=1, \emptyset),(\text { unlock } s,\{s\})\}) \\
& B^{\prime}=(\emptyset,\{s \mapsto 1\},\{(!s:=0, \emptyset),(!s:=1, \emptyset),(\text { unlock } s,\{s\})\})
\end{aligned}
$$

Cell $s$ is locked in both $A^{\prime}$ and $B^{\prime}$. When a cell is locked, the attacker cannot see its value until it is unlocked. Both $A^{\prime}$ and $B^{\prime}$ can adjust the value of cell s after unlock $s$. Assume

$$
A^{\prime} \xrightarrow{\tau(s)}(\emptyset,\{s \mapsto 0\},\{(!s:=0, \emptyset),(!s:=1, \emptyset),(0, \emptyset)\})
$$

Then $B^{\prime}$ can match this transition by first unlocking the cell $s$ and then doing a writing $s:=0$ and evolving to exactly the same process:

$$
\begin{aligned}
& B^{\prime} \xrightarrow{\tau(s)}(\emptyset,\{s \mapsto 1\},\{(!s:=0, \emptyset),(!s:=1, \emptyset),(0, \emptyset)\}) \\
& \xrightarrow{\tau(s)}(\emptyset,\{s \mapsto 0\},\{(!s:=0, \emptyset),(!s:=1, \emptyset),(0, \emptyset)\})
\end{aligned}
$$

Intuitively, the locked or unlocked status of a public state cell is observable by the environment. Therefore, we require $\operatorname{locks}(A)=\operatorname{locks}(B)$ and $f s(A)=f s(B)$ in the definition of observational equivalence. Furthermore, without this condition, this definition would not yield an equivalence relation, as transitivity does not hold in general. For example, consider the following extended processes,

$$
\begin{aligned}
& A=(\emptyset,\{s \mapsto 0\},\{(!s:=0, \emptyset),(!s:=1, \emptyset),(!\text { lock } s . \text { unlock } s, \emptyset)\}) \\
& B=(\emptyset,\{s \mapsto 1\},\{(!s:=0, \emptyset),(!s:=1, \emptyset),(!\text { lock } s . \text { unlock } s, \emptyset),(\text { unlock } s,\{s\})\}) \\
& C=(\emptyset,\{s \mapsto 1\},\{(!s:=0, \emptyset),(!s:=1, \emptyset),(!\text { lock } s . u n l o c k ~ s, \emptyset)\})
\end{aligned}
$$

Without the condition, then $A$ and $B$ would be equivalent, as well as $B$ and $C$, because the value in $s$ can always be adjusted to be exactly the same after unlock $s$. But $A$ and $C$ are not equivalent as analysed in Example 25 .

Example 26. The value in an unlocked public state cell is a part of the attacker's knowledge. Assume

$$
\begin{aligned}
& A=\nu k .(\emptyset,\{s \mapsto k\},\{(s:=0 . a(x) . \text { if } x=k \text { then } \bar{c}\langle b\rangle, \emptyset)\}) \\
& B=\nu k .(\emptyset,\{s \mapsto k\},\{(s:=0 . a(x), \emptyset)\})
\end{aligned}
$$

$A$ and $B$ are not observationally equivalent. Let $\mathcal{C}=(-,-,\{(\operatorname{read} s$ as $y . \bar{a}\langle y\rangle, \emptyset)\}-)$. Then $\mathcal{C}[A] \Downarrow_{c}$ but $\mathcal{C}[B] \Downarrow_{c}$ because

$$
\begin{aligned}
\mathcal{C}[A] & \xrightarrow{\tau(s)} \nu k .(\emptyset,\{s \mapsto k\},\{(\bar{a}\langle k\rangle, \emptyset),(s:=0 . a(x) . \text { if } x=k \text { then } \bar{c}\langle b\rangle, \emptyset)\}) \\
& \xrightarrow{\tau(s)} \nu k \cdot(\emptyset,\{s \mapsto 0\},\{(\bar{a}\langle k\rangle, \emptyset),(a(x) . \text { if } x=k \text { then } \bar{c}\langle b\rangle, \emptyset)\}) \\
& \Longrightarrow k .(\emptyset,\{s \mapsto 0\},\{(\bar{c}\langle b\rangle, \emptyset)\})
\end{aligned}
$$

But there is no output on channel $c$ in $C[B]$. Hence $A \not \approx B$.
Example 27. The attacker can write an arbitrary value into an unlocked public cell. Assume two extended processes

$$
A=(\emptyset,\{s \mapsto 0\},\{(s:=0 . s:=0, \emptyset)\}) \quad B=(\emptyset,\{s \mapsto 0\},\{(s:=0, \emptyset)\})
$$

$A$ and $B$ are not observationally equivalent. Applying $\mathcal{C}=(-,-,\{(s:=1 . s:=1, \emptyset)\}-)$ to both $A$ and $B$, the interleaving of $s:=0$ and $s:=1$ can generate a sequence of values $0,1,0,1,0$ in cell sin $\mathcal{C}[A]$, while the closest sequence generated by $\mathcal{C}[B]$ should be $0,1,0,1,1$. So when the attacker keeps on reading the value in cell $s$, he would be able to notice the difference.

Instead of using the primitive open $s$, an alternative way for making a private state cell become public is to send cell name $s$ on a free channel $\bar{c}\langle s\rangle . P$. The reason we choose the primitive open s.P here is because sending and receiving cell names through channels is too powerful, and will lead to soundness problems when we define labelled bisimilarity later. For example, let

$$
A=(\emptyset, \emptyset,\{(c(x) \cdot \mathrm{read} x \text { as } z \cdot \bar{a}\langle z\rangle, \emptyset)\}) \quad B=(\emptyset, \emptyset,\{(c(x), \emptyset)\})
$$

In the presence of input and output for cell names, $A$ and $B$ are not observationally equivalent. Let $\mathcal{C}=(-,\{t \mapsto 0\}-,\{(\bar{c}\langle t\rangle, \emptyset)\}-)$. The context $\mathcal{C}$ brings his own state cell $t \mapsto 0$ and we have $\mathcal{C}[A] \Downarrow_{a}$ but $\mathcal{C}[B] \psi_{a}$. That is to say, in order to define a sound labelled bisimilarity, we have to allow a process like $(\emptyset, \emptyset,\{(\operatorname{read} t$ as $z \cdot \bar{a}\langle z\rangle, \emptyset)\})$ to perform the reading even without a state cell $t \mapsto 0$. This requires a rather complex definition of labelled bisimilarity, while what we want is to simply free a cell which can be achieved by open s.P.

Now we give examples of the use of public state cells for modelling protocols and security properties. Another security concern for RFID tags is forward privacy [28]. In the following Example 28 and Example 29, we shall illustrate how to model forward privacy by public state cells. Forward privacy requires that even the attacker breaks the tag, the past events should still be untraceable. Public state cells enable us to model the compromised tags.

Example 28. We consider an improved version of the naive protocol in Example 2 Instead of simply outputting the tag's id, the tag generates a random number $r$, hashes its id concatenated with $r$ and then sends both $r$ and $h(i d, r)$ to the reader for identification. This can be modelled by:

$$
Q(s)=\operatorname{read} s \text { as } x . \nu r . \bar{a}\langle(r, h(x, r))\rangle
$$

Upon receiving the value, the reader identifies the tag by performing a brute-force search of its known ids. By observing on channel a, the attacker can get the data pairs from a particular tag $s:\left(r_{1}, h\left(i d, r_{1}\right)\right),\left(r_{2}, h\left(i d, r_{2}\right)\right),\left(r_{3}, h\left(i d, r_{3}\right)\right) \cdots$. Since the hash function is not invertible, without knowing the value of id, these data appear as just random data to the attacker. Hence this improved version satisfies the untraceability defined in Example 2 But it does not have the forward privacy. Let RD be process modelling the reader and back-end database. The forward privacy can be characterised by the observational equivalence

$$
\begin{aligned}
& (\emptyset, \emptyset,\{(!\nu s, i d \cdot([s \mapsto i d]|Q(s)| \text { open } s .!Q(s) \mid R D), \emptyset)\}) \\
& \quad \approx(\emptyset, \emptyset,\{(!\nu s, i d \cdot([s \mapsto i d]|!Q(s)| \text { open } s \mid R D), \emptyset)\})
\end{aligned}
$$

The primitive open $s$ makes the private state cell s become public. Before the cell $s$ is broken, the attacker cannot decide how the system runs. In other words, whether the tag $s$ is used for only once, namely $Q(s)$, or is used for arbitrary number of times, namely $!Q(s)$, it is out of the control of the attacker. But after the tag is broken, the attacker fully controls the tag, so he knows when and where the tag is used. Despite knowing the events that happen after the tag is broken, the attacker should still not be able to trace the past events. Therefore, in the first process, we add! $Q(s)$ after open $s$ to model this scenario. Intuitively, only the events before the tag is broken may be different while the events after the tag is broken are exactly the same. Hence the above observational equivalence can capture forward privacy.

However the above equivalence does not hold which means there is no forward privacy in this protocol. The attacker can obtain the id from the broken tag and then verify whether the previously gathered data $\left(r_{1}, h\left(i d, r_{1}\right)\right)$ and $\left(r_{2}, h\left(i d, r_{2}\right)\right)$ refer to the same tag id by hashing id with $r_{1}$ (or $r_{2}$ ) and then comparing the result with $h\left(i d, r_{1}\right)\left(\right.$ or $h\left(i d, r_{2}\right)$ ).

Example 29. Continuing with the OSK protocol in Example 3 we model the forward privacy by the observational equivalence:

$$
\begin{aligned}
& (\emptyset, \emptyset,\{(!\nu s, k \cdot([s \mapsto k]|T(s)| \text { open } s .!T(s) \mid R D), \emptyset)\}) \\
& \quad \approx(\emptyset, \emptyset,\{(!\nu s, k \cdot([s \mapsto k]|!T(s)| \text { open } s \mid R D), \emptyset)\})
\end{aligned}
$$

Before the tag is broken, the attacker can get a sequence $g(k), g(h(k)), g(h(h(k))), \cdots$ by eavesdropping on channel a. Right after each reading, the value in the tag will be updated to the hash of previous value: $h(k), h(h(k)), h(h(h(k))) \cdots$. When the tag is broken, the attacker will get from the tag a value $h^{i}(k)$ for some integer $i$. This value is not helpful for the attacker to infer whether the data $g(k), g(h(k)), \cdots, g\left(h^{i-1}(k)\right)$ are from the same tag. Hence the OSK protocol can ensure the forward privacy.

### 6.2. Labelled Bisimilarity

In order to ease the verification of observational equivalence which is defined using the universal quantifier over contexts, we shall define labelled bisimilarity which replaces quantification over contexts by suitably labelled transitions. The traditional definition for labelled bisimilarity is neither sound nor complete w.r.t. observational
equivalence in the presence of public state cells. We propose a novel definition for labelled bisimilarity and show how it solves all the problems caused by public state cells.

For a given cell $s$, we define $\stackrel{\tau(s)}{\Longrightarrow}$ to be the reflexive and transitive closure of $\xrightarrow{\tau}$ and $\xrightarrow{\tau(s)}$. We still use $\alpha$ to range over $\tau, a(M), \bar{a}\langle c\rangle, \nu c \cdot \bar{a}\langle c\rangle$ and $\nu x . \bar{a}\langle x\rangle$, and use $\Longrightarrow$ for the reflexive and transitive closure of $\xrightarrow{\tau}$, and use $\xlongequal{\widehat{\alpha}}$ for $\xlongequal{\alpha}$ if $\alpha$ is not $\tau$ and for $\Longrightarrow$ if $\alpha=\tau$. Note that $\alpha$ cannot be $\tau(s)$.

To define labelled bisimilarity, we need an auxiliary transition relation $\xrightarrow{s:=N}$ for setting the values of public state cells:

$$
\begin{array}{rll}
\nu \widetilde{n} \cdot(\sigma, S \cup\{s \mapsto M\}, \mathcal{P}) \quad \xrightarrow{s:=N} \quad & \nu \widetilde{n} \cdot(\sigma, S \cup\{s \mapsto N \sigma\}, \mathcal{P}) \\
& & \text { if } s \notin \widetilde{n} \cup \operatorname{locks}(\mathcal{P}) \text { and } \operatorname{name}(N) \cap \widetilde{n}=\emptyset \\
\nu \widetilde{n} \cdot(\sigma, S, \mathcal{P}) \quad \xrightarrow{s:=N} \quad & \nu \widetilde{n} \cdot(\sigma, S, \mathcal{P}) \text { if } s \in \widetilde{n} \cup \operatorname{locks}(\mathcal{P})
\end{array}
$$

The first rule of $\xrightarrow{s:=N}$ represents the attacker's ability to overwrite the public state cells. The second rule does not change the value of the cell $s$ and is just for compatibility with unlock $s$ and open $s$ in Definition 31 . We write $A \xrightarrow{s:=N} \xrightarrow{\tau(s)} A^{\prime}$ for the combination of transitions $A \xrightarrow{s:=N} B$ and $B \xrightarrow{\tau(s)} A^{\prime}$ for some $B$.

Definition 30. Given two extended processes $A_{i}=\nu \widetilde{n}_{i} \cdot\left(\sigma_{i}, S_{i}, \mathcal{P}_{i}\right)(i=1,2)$ such that $\operatorname{dom}\left(\sigma_{1}\right)=\operatorname{dom}\left(\sigma_{2}\right)$ and $f s\left(A_{1}\right)=f_{s}\left(A_{2}\right)$ and $\operatorname{locks}\left(A_{1}\right)=\operatorname{locks}\left(A_{2}\right)$. We define extensible state cells esc $\left(A_{1}, A_{2}\right)$ of $A_{1}$ and $A_{2}$ as

$$
\begin{aligned}
& \operatorname{esc}\left(A_{1}, A_{2}\right):= \\
& \quad\left\{s \mid s \in f s\left(A_{1}\right) \backslash \operatorname{locks}\left(A_{1}\right), \nexists x \in \operatorname{dom}\left(\sigma_{1}\right) \text { s.t. } S_{1}(s)=x \sigma_{1} \text { and } S_{2}(s)=x \sigma_{2}\right\}
\end{aligned}
$$

Intuitively, esc $\left(A_{1}, A_{2}\right)$ is a chosen subset of unlocked public state cells of $A_{1}, A_{2}$ such that the values of those cells haven't been extended into the substitutions of $A_{1}, A_{2}$.

Definition 31. Labelled bisimilarity $\left(\approx_{l}\right)$ is the largest symmetric relation $\mathcal{R}$ between pairs of closed extended processes $A_{i}=\nu \widetilde{n}_{i} \cdot\left(\sigma_{i}, S_{i}, \mathcal{P}_{i}\right)$ with $i=1,2$ such that $A_{1} \mathcal{R} A_{2}$ implies

1. $\operatorname{locks}\left(A_{1}\right)=\operatorname{locks}\left(A_{2}\right), f s\left(A_{1}\right)=f s\left(A_{2}\right)$ and $\operatorname{dom}\left(A_{1}\right)=\operatorname{dom}\left(A_{2}\right)$;
2. Select a fresh base variable $x_{s}$ for each $s \in \operatorname{esc}\left(A_{1}, A_{2}\right)$. Let

$$
A_{i}^{e}=\nu \widetilde{n}_{i} \cdot\left(\sigma_{i} \cup\left\{S_{i}(s) / x_{s}\right\}_{s \in \operatorname{esc}\left(A_{1}, A_{2}\right)}, S_{i}, \mathcal{P}_{i}\right) \text { for } i=1,2
$$

Then
(a) $A_{1}^{e} \approx_{s} A_{2}^{e}$;
(b) if $A_{1}^{e} \xrightarrow{s:=N} \xrightarrow{\tau(s)} B_{1}$ with $\operatorname{var}(N) \subseteq \operatorname{dom}\left(A_{1}^{e}\right)$, then there exists $B_{2}$ such that $A_{2}^{e} \xrightarrow{s:=N} \xrightarrow{\tau(s)} B_{2}$ and $B_{1} \mathcal{R} B_{2}$;
(c) if $A_{1}^{e} \xrightarrow{\alpha} B_{1}$ and $f v(\alpha) \subseteq \operatorname{dom}\left(A_{1}^{e}\right)$ and $\operatorname{bnv}(\alpha) \cap \operatorname{fnv}\left(A_{2}^{e}\right)=\emptyset$, then there exists $B_{2}$ such that $A_{2}^{e} \xlongequal{\widehat{\alpha}} B_{2}$ and $B_{1} \mathcal{R} B_{2}$.

The static equivalence $A_{1}^{e} \approx_{s} A_{2}^{e}$ in Definition 31 is exactly the same as the one defined in Definition 4 Before we compare the static equivalence and the transitions in labelled bisimilarity, we extend $A_{i}$ to $A_{i}^{e}$ with values from unlocked public state cells. This is to reflect the fact that attacker's ability to read values from these cells.

Example 32. Consider the extended processes $A$ and $B$ in Example 25. As we have already shown, $A$ and $B$ are not observationally equivalent. Hence they are not supposed to be labelled bisimilar. We first extend $A$ and $B$ to $A^{e}$ and $B^{e}$ respectively:

$$
\begin{aligned}
& A^{e}=(\{0 / z\},\{s \mapsto 0\},\{(!s:=0, \emptyset),(!s:=1, \emptyset)\}) \\
& B^{e}=(\{1 / z\},\{s \mapsto 1\},\{(!s:=0, \emptyset),(!s:=1, \emptyset)\})
\end{aligned}
$$

Clearly the static equivalence between $A^{e}$ and $B^{e}$ does not hold, namely $A^{e} \not \approx s B^{e}$, because the test $z=0$ can distinguish them. Thus we have $A \not \approx_{l} B$.

The extension is not only for comparing the static equivalence, but also for comparing the transitions. In labelled bisimilarity, we compare the transitions starting from the extensions $A^{e}$ and $B^{e}$, rather than the original processes $A$ and $B$. The reason is that we need to keep a copy of the cell values, otherwise we would lose the values when someone overwrites the cells.

Example 33. Consider the extended processes $A$ and $B$ in Example 26. The extension $A^{e}$ of $A$ can perform the following transition:

$$
\begin{aligned}
& A^{e}=\nu k \cdot(\{k / z\},\{s \mapsto k\},\{(s:=0 . a(x) . \text { if } x=k \text { then } \bar{c}\langle b\rangle, \emptyset)\}) \\
& \xrightarrow{\tau(s)} \nu k \cdot(\{k / z\},\{s \mapsto 0\},\{(a(x) \cdot \text { if } x=k \text { then } \bar{c}\langle b\rangle, \emptyset)\}) \\
& \stackrel{a(z)}{\Longrightarrow} \nu k \cdot(\{k / z\},\{s \mapsto 0\},\{(\bar{c}\langle b\rangle, \emptyset)\}) \\
& \xrightarrow{\bar{c}\langle b\rangle} \nu k \cdot(\{k / z\},\{s \mapsto 0\},\{(0, \emptyset)\})
\end{aligned}
$$

But it is impossible for $B$ 's extension $B^{e}=\nu k .(\{k / z\},\{s \mapsto k\},\{(s:=0 . a(x), \emptyset)\})$ to perform an output on channel c. Hence $A \not 夫_{l} B$.

We use $\xrightarrow{s:=N} \xrightarrow{\tau(s)}$ rather than $\xrightarrow{\tau(s)}$ in labelled bisimilarity because the attacker can set any unlocked public state cell to an arbitrary value. We shall illustrate this point by the following two examples.

## Example 34. Assume

$$
\begin{aligned}
& A=(\{0 / y, 1 / z\},\{s \mapsto 0\},\{(\operatorname{read} s \text { as } x . \text { if } x=1 \text { then } \bar{c}\langle 0\rangle, \emptyset)\}) \\
& B=(\{0 / y, 1 / z\},\{s \mapsto 0\}, \emptyset)
\end{aligned}
$$

$A$ and $B$ are not observationally equivalent. Applying context $\mathcal{C}=(\emptyset, \emptyset,\{(s:=1, \emptyset)\})$ to $A$ and $B$, we can see that $\mathcal{C}[A] \Downarrow_{c}$ but $\mathcal{C}[B] \psi_{c}$.

Now we shall distinguish them in labelled bisimilarity. Since the current value in cell $s$ is 0 which has already been stored in variable $y$, we don't need to extend $A$ and $B$. Then A can perform the following transition

$$
\begin{aligned}
A \xrightarrow{s:=1} & \xrightarrow{\tau(s)}(\{0 / y, 1 / z\},\{s \mapsto 1\},\{(\text { if } 1=1 \text { then } \bar{c}\langle a\rangle, \emptyset)\}) \\
& \xrightarrow{\bar{c}\langle a\rangle}(\{0 / y, 1 / z\},\{s \mapsto 1\},\{0, \emptyset\})
\end{aligned}
$$

But there is no way for $B$ to perform an output action. Hence $A \not \approx_{l} B$.
Example 35. As illustrated in Example 27, $A$ and $B$ are not observationally equivalent. In labelled bisimilarity, we first extend $A$ and $B$ to $A_{1}^{e}$ and $B_{1}^{e}$ :

$$
\begin{aligned}
& A_{1}^{e}=(\{0 / x\},\{s \mapsto 0\},\{(s:=0 . s:=0, \emptyset)\}) \\
& B_{1}^{e}=(\{0 / x\},\{s \mapsto 0\},\{(s:=0, \emptyset)\})
\end{aligned}
$$

Then let $A_{1}^{e}$ perform actions $\xrightarrow{s:=1} \xrightarrow{\tau(s)}$,

$$
A_{1}^{e} \xrightarrow{s:=1} \xrightarrow{\tau(s)} A_{2}^{e}=(\{0 / x\},\{s \mapsto 0\},\{(s:=0, \emptyset)\})
$$

Note that action $\xrightarrow{s:=1}$ sets the value of cell s to 1 . Hence, $B_{1}^{e}$ can only match the above transition by resetting the value of cell s to 0 :

$$
B_{1}^{e} \xrightarrow{s:=1} \xrightarrow{\tau(s)} B_{2}^{e}=(\{0 / x\},\{s \mapsto 0\},\{(0, \emptyset)\})
$$

Since the values of cell s in $A_{2}^{e}$ and $B_{2}^{e}$ are still 0 which have already been stored in variable $x$, we don't need to extend them again. Then let $A_{2}^{e}$ perform the actions $\xrightarrow{s:=1} \xrightarrow{\tau(s)}$ :

$$
A_{2}^{e} \xrightarrow{s:=1} \xrightarrow{\tau(s)} A_{3}^{e}=(\{0 / x\},\{s \mapsto 0\},\{(0, \emptyset)\})
$$

But now what $B_{2}^{e}$ can do is just

$$
B_{2}^{e} \xrightarrow{s:=1} \Longrightarrow B_{3}^{e}=(\{0 / x\},\{s \mapsto 1\},\{(0, \emptyset)\})
$$

Extending $A_{2}^{e}$ and $B_{2}^{e}$ to the following $A^{\prime}$ and $B^{\prime}$ :

$$
\begin{aligned}
A^{\prime} & =(\{0 / x, 0 / z\},\{s \mapsto 0\},\{(0, \emptyset)\}) \\
B^{\prime} & =(\{0 / x, 1 / z\},\{s \mapsto 1\},\{(0, \emptyset)\})
\end{aligned}
$$

We can see that $A^{\prime} \not \chi_{s} B^{\prime}$ because the test $z=0$ can distinguish them. Thus $A$ and $B$ are not labelled bisimilar, i.e. $A \not \approx_{l} B$.

Note that the transition $\xrightarrow{s:=N}$ is not included in $\xrightarrow{\alpha}$. We only need to use $\xrightarrow{s:=N}$ to change the value of the unlocked public state cell $s$ when the processes perform some actions related to $s$. Comparing the combination of two transitions together $(\xrightarrow{s:=N} \xrightarrow{\tau(s)})$ in Definition 31 optimises the definition to be better suited as an assisted
tool for analysing observational equivalence. Otherwise, if we follow the traditional way to define labelled bisimilarity, i.e. comparing $A_{1}^{e} \xrightarrow{s:=N} B_{1}^{e}$ and $A_{1}^{e} \xrightarrow{\tau(s)} B_{1}^{e}$ separately, the action $\xrightarrow{s:=N}$ would generate infinitely many unnecessary branches. For example, let $A=(\emptyset,\{s \mapsto 0\}, \emptyset)$. Even there is no action, $A$ could keep on performing $\xrightarrow{s:=N}$ and would never stop: $A \xrightarrow{s:=1}(\emptyset,\{s \mapsto 1\}, \emptyset) \xrightarrow{s:=2}(\emptyset,\{s \mapsto 2\}, \emptyset) \xrightarrow{s:=3}$ $(\emptyset,\{s \mapsto 3\}, \emptyset) \cdots$

We require $A_{1}^{e} \xrightarrow{s:=N} \xrightarrow{\tau(s)} B_{1}$ to be matched by $A_{2}^{e} \xrightarrow{s:=N} \xrightarrow{\tau(s)} B_{2}$ with the same $s$ in the action in labelled bisimilarity. In other words, $A_{2}^{e}$ can only match the transition of $A_{1}^{e}$ by at most operating on the same cell $s$. This is equal to say the attacker holds the locks of all the unlocked public cell except cell $s$ in $A_{1}^{e}$. If $A_{1}^{e}$ does not do act on cell $s$, then $A_{2}^{e}$ are not allowed to match $A_{1}^{e}$ by operating on $s$.

Example 36. Extend $A$ and $B$ in Example 24 to $A^{e}=(\{0 / z\},\{s \mapsto 0\},\{(\bar{c}\langle b\rangle, \emptyset)\})$ and $B^{e}=(\{0 / z\},\{s \mapsto 0\},\{(\operatorname{read} s$ as $x . \bar{c}\langle b\rangle, \emptyset)\})$. We can see that $A^{e} \xrightarrow{\bar{c}\langle b\rangle}$ $(\emptyset,\{s \mapsto 0\},\{(0, \emptyset)\})$, but there is no way for $B^{e}$ to do the same output action $\bar{c}\langle b\rangle$ without going through the reading on cell s. Hence $A \not \not \approx l B$.

### 6.3. Soundness and Completeness

In this section, we will show our labelled bisimilarity given in Definition 31 can fully capture the observational equivalence given in Definition 23

The following lemma states that labelled bisimilarity is closed when adding substitutions for terms stored in extensible state cells:

Lemma 37. Assume $A_{1} \approx_{l} A_{2}$ where $A_{i}=\nu \widetilde{n}_{i} .\left(\sigma_{i}, S_{i}, \mathcal{P}_{i}\right)$ for $i=1,2$. Assume $\operatorname{esc}\left(A_{1}, A_{2}\right)=\left\{s_{k}\right\}_{k \in I}$ and $\left\{s_{k} \mapsto M_{k}^{i}\right\}_{k \in I} \subseteq S_{i}$ for some terms $M_{k}^{i}$. Select fresh variables $\left\{z_{k}\right\}_{k \in I}$, then

$$
\nu \widetilde{n}_{1} \cdot\left(\sigma_{1} \cup\left\{M_{k}^{1} / z_{k}\right\}_{k \in I}, S_{1}, \mathcal{P}_{1}\right) \approx_{l} \nu \widetilde{n}_{2} \cdot\left(\sigma_{2} \cup\left\{M_{k}^{2} / z_{k}\right\}_{k \in I}, S_{2}, \mathcal{P}_{2}\right)
$$

Proof. We construct the following set $\mathcal{R}$ :

$$
\begin{aligned}
& \mathcal{R}:= \\
& \left\{\left(\nu \widetilde{n}_{1} \cdot\left(\sigma_{1} \cup\left\{M_{k}^{1} / z_{k}\right\}_{k \in I}, S_{1}, \mathcal{P}_{1}\right), \nu \widetilde{n}_{2} \cdot\left(\sigma_{2} \cup\left\{M_{k}^{2} / z_{k}\right\}_{k \in I}, S_{2}, \mathcal{P}_{2}\right)\right) \mid\right. \\
& A_{1} \approx_{l} A_{2} \text { where } A_{i}=\nu \widetilde{n}_{i} \cdot\left(\sigma_{i}, S_{i}, \mathcal{P}_{i}\right) \text { for } i=1,2,\left\{s_{k}\right\}_{k \in I}=\operatorname{esc}\left(A_{1}, A_{2}\right), \\
& \left.\qquad\left\{s_{k} \mapsto M_{k}^{i}\right\}_{k \in I} \subseteq S_{i} \text { for } i=1,2,\left\{z_{k}\right\}_{k \in I} \text { are fresh variables }\right\} \cup \approx_{l}
\end{aligned}
$$

We shall prove $\mathcal{R} \subseteq \approx_{l}$. Let $B_{i}=\nu \widetilde{n}_{i} \cdot\left(\sigma_{i} \cup\left\{M_{k}^{i} / z_{k}\right\}_{k \in I}, S_{i}, \mathcal{P}_{i}\right)$ for $i=1,2$. According to the definition of extensible state cells, we can easily see that esc $\left(B_{1}, B_{2}\right)=$ $\emptyset$. Hence we do not need to extend $B_{1}, B_{2}$ when comparing them for labelled bisimilarity. In other words, $B_{1}, B_{2}$ are both extensions of $A_{1}, A_{2}$ and $B_{1}, B_{2}$. Since $A_{1} \approx_{l} A_{2}$, we have $B_{1} \approx_{s} B_{2}$ by Definition 31 .

Now we proceed to check the behaviour equivalence between $B_{1}$ and $B_{2}$.

1. Assume $B_{1} \xrightarrow{s:=N} \xrightarrow{\tau(s)} B_{1}^{\prime}$ with $\operatorname{var}(N) \subseteq \operatorname{dom}\left(B_{1}\right)$ and $s$ public and unlocked. Since $A_{1} \approx_{l} A_{2}$ and their extensions are $B_{1}, B_{2}$, we know there exists $B_{2}^{\prime}$ such that $B_{2} \xrightarrow{s:=N} \xrightarrow{\tau(s)} B_{2}^{\prime} \approx_{l} B_{1}^{\prime}$. By the construction of $\mathcal{R}$, we know $\left(B_{1}^{\prime}, B_{2}^{\prime}\right) \in \mathcal{R}$.
2. Assume $B_{1} \xrightarrow{\alpha} B_{1}^{\prime}$ with $f v(\alpha) \subseteq \operatorname{dom}\left(A_{1}\right)$ and $\operatorname{bnv}(\alpha) \cap f n v\left(B_{2}\right)=\emptyset$. Since $A_{1} \approx_{l} A_{2}$ and their extensions are $B_{1}, B_{2}$, we know there exists $B_{2}^{\prime}$ such that $B_{2} \xlongequal{\widehat{\alpha}}$ $B_{2}^{\prime} \approx_{l} B_{1}^{\prime}$. According to the construction of $\mathcal{R}$, we know $\left(B_{1}^{\prime}, B_{2}^{\prime}\right) \in \mathcal{R}$.

Now we proceed to prove the soundness of our labelled bisimilarity for public state cells:

Proposition 38 (Soundness). If $A \approx_{l} B$ then $A \approx B$.

Proof. It is sufficient to prove that $\approx_{l}$ is a congruence. We construct the following set:
$\mathcal{R}=\left\{\left(\mathcal{C}\left[A_{1}\right]_{\backslash \widetilde{x}}, \mathcal{C}\left[A_{2}\right]_{\backslash \widetilde{x}}\right) \mid A_{1} \approx_{l} A_{2}\right.$, a closing evaluation context $\left.\mathcal{C}, \widetilde{x} \subseteq \operatorname{dom}\left(A_{1}\right)\right\}$
and prove that $\mathcal{R} \subseteq \approx_{l}$. Note that this is sufficient for proving $\approx_{l} \subseteq \approx_{\text {. For any }} A \mathcal{R} B$, because $\mathcal{R} \subseteq \approx_{l}$, we have $A \approx_{l} B$. Then we can easily check the conditions (i), (ii), (iii) in Definition 23 hold. For the condition (iv), since $A \approx_{l} B$, by the construction of $\mathcal{R}$, we can see $(\mathcal{C}[A], \mathcal{C}[B]) \in \mathcal{R}$ by letting $\widetilde{x}=\emptyset$. Therefore $\mathcal{R} \subseteq \approx$.

Assume $\left(\mathcal{C}\left[A_{1}\right]_{\backslash \widetilde{x}}, \mathcal{C}\left[A_{2}\right]_{\backslash \tilde{x}}\right) \in \mathcal{R}$ because of $A_{1} \approx_{l} A_{2}$ where $\mathcal{C}=\nu \widetilde{n} .(\sigma-, S-, \mathcal{P}-)$ and $A_{i}=\nu \widetilde{n}_{i} \cdot\left(\sigma_{i}, S_{i}, \mathcal{P}_{i}\right)$ with $i=1,2$. By Definition 31, we will first extend $\mathcal{C}\left[A_{1}\right]_{\backslash \widetilde{x}}, \mathcal{C}\left[A_{2}\right]_{\backslash \widetilde{x}}$ with substitutions for their extensible state cells, and then show the static equivalence and behavior equivalence between the extensions.

Assume the extensible state cells

$$
\begin{aligned}
\operatorname{esc}\left(\mathcal{C}\left[A_{1}\right]_{\backslash \widetilde{x}}, \mathcal{C}\left[A_{2}\right]_{\backslash \widetilde{x}}\right) & =\left\{r_{k}\right\}_{k \in I_{r}} \cup\left\{s_{k}\right\}_{k \in I_{s}} \cup\left\{\delta_{k}\right\}_{k \in \Delta} \\
\operatorname{esc}\left(A_{1}, A_{2}\right) & =\left\{s_{k}\right\}_{k \in I_{s}} \cup\left\{t_{k}\right\}_{k \in I_{t}}
\end{aligned}
$$

where $\left\{r_{k}\right\}_{k \in I_{r}} \subseteq \operatorname{dom}(S),\left\{\delta_{k}\right\}_{k \in \Delta} \subseteq \operatorname{dom}\left(S_{i}\right)$ and $\left\{s_{k}\right\}_{k \in I_{s}} \subseteq \operatorname{dom}\left(S_{i}\right)$ for $i=1,2$. Intuitively, $\left\{t_{k}\right\}_{k \in I_{t}}$ are the extensible state cells for $A_{1}, A_{2}$ but become inextensible because of the application of context $\mathcal{C}$ (for example, the context $\mathcal{C}$ may have a restriction $\nu s$ which makes an extensible public cell $s$ private, or $\mathcal{C}$ may introduce a substitution which has the value of the cell $s$ ). $\left\{\delta_{k}\right\}_{k \in \Delta}$ are the public cells from $\operatorname{dom}\left(S_{i}\right)$, and are not extensible in $A_{i}$ because of the substitutions on $\widetilde{x}$, but they become extensible in $\mathcal{C}\left[A_{i}\right]_{\backslash \widetilde{x}}$ because the substitutions on $\widetilde{x}$ are removed. By Definition 30 of extensible cells, there exists $\left\{x_{j_{k}}\right\}_{k \in \Delta}$ with $x_{j_{k}} \in \widetilde{x}$ and $S_{i}\left(\delta_{k}\right)=x_{j_{k}} \sigma_{i}$ for $k \in \Delta$ and $i=$ 1, 2. Select pairwise-distinct fresh variables $\left\{z_{r_{k}}\right\}_{k \in I_{r}},\left\{z_{s_{k}}\right\}_{k \in I_{s}},\left\{z_{t_{k}}\right\}_{k \in I_{t}},\left\{z_{\delta_{k}}\right\}_{k \in \Delta}$ and let $\sigma_{r}=\left\{S\left(r_{k}\right) / z_{r_{k}}\right\}_{k \in I_{r}}$ and $\sigma_{s}^{i}=\left\{S_{i}\left(s_{k}\right) / z_{s_{k}}\right\}_{k \in I_{s}}$ and $\sigma_{t}^{i}=\left\{S_{i}\left(t_{k}\right) / z_{t_{k}}\right\}_{k \in I_{t}}$ and $\widehat{\sigma}=\left\{x_{j_{k}} / z_{\delta_{k}}\right\}_{k \in \Delta}$. Let

$$
\varphi_{i}=\sigma_{i} \cup \sigma_{s}^{i} \cup \sigma_{t}^{i} \quad \quad \varphi_{i}^{e}=\sigma \sigma_{i} \cup \sigma_{r} \sigma_{i} \cup \widehat{\sigma} \sigma_{i} \cup \sigma_{i \backslash \widetilde{x}} \cup \sigma_{s}^{i}
$$

Then we extend process $A_{i}$ by adding substitutions for extensible state cells, i.e., $\sigma_{s}^{i}$ and $\sigma_{t}^{i}$, with $i=1,2$ :

$$
B_{i}:=\nu \widetilde{n}_{i} \cdot\left(\varphi_{i}, S_{i}, \mathcal{P}_{i}\right)
$$

Since $A_{1} \approx_{l} A_{2}$, using Lemma 37 , we get $B_{1} \approx_{l} B_{2}$. Also we extend process $\mathcal{C}\left[A_{i}\right]_{\backslash \widetilde{x}}$ by adding substitutions for extensible state cells, i.e., $\sigma_{r} \sigma_{i} \cup \widehat{\sigma} \sigma_{i} \cup \sigma_{s}^{i}$, for $i=1,2$ :

$$
D_{i}:=\nu \widetilde{n}, \widetilde{n}_{i} \cdot\left(\varphi_{i}^{e}, S \sigma_{i} \cup S_{i}, \mathcal{P} \sigma_{i} \cup \mathcal{P}_{i}\right)
$$

We first prove the static equivalence $D_{1} \approx_{s} D_{2}$. Assume terms $N_{1}, N_{2}$ with $\operatorname{var}\left(N_{1}, N_{2}\right) \subseteq \operatorname{dom}\left(\varphi_{1}^{e}\right)$ and $N_{1} \varphi_{1}^{e}=_{\Sigma} N_{2} \varphi_{1}^{e}$, we will show that $N_{1} \varphi_{2}^{e}=_{\Sigma} N_{2} \varphi_{2}^{e}$. We can see that $N_{k} \varphi_{i}^{e}=N_{k}\left(\sigma \sigma_{i} \cup \sigma_{r} \sigma_{i} \cup \widehat{\sigma} \sigma_{i} \cup \sigma_{i \backslash \widetilde{x}} \cup \sigma_{s}^{i}\right)=\left(N_{k}\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}\right)\right)\left(\sigma_{i} \cup \sigma_{s}^{i}\right)$ for $k=1,2$ and $i=1,2$. Since $\mathcal{C}$ closes $A_{i}$, we can see that $\operatorname{var}\left(N_{k}\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}\right)\right) \subseteq$ $\operatorname{dom}\left(\varphi_{i}\right)$ for $k=1,2$. Thus we have $N_{k} \varphi_{i}^{e}=\left(N_{k}\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}\right)\right) \varphi_{i}$. From the hypothesis $N_{1} \varphi_{1}^{e}=_{\Sigma} N_{2} \varphi_{1}^{e}$, we know $\left(N_{1}\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}\right)\right) \varphi_{1}=_{\Sigma}\left(N_{2}\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}\right)\right) \varphi_{1}$. From $B_{1} \approx_{s} B_{2}$, we know that $\left(N_{1}\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}\right)\right) \varphi_{2}=_{\Sigma}\left(N_{2}\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}\right)\right) \varphi_{2}$. From $N_{k} \varphi_{i}^{e}=\left(N_{k}\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}\right)\right) \varphi_{i}$, we know that $N_{1} \varphi_{2}^{e}={ }_{\Sigma} N_{2} \varphi_{2}^{e}$. Hence $D_{1} \approx_{s} D_{2}$.

Now we proceed to prove the behavioural equivalence between $D_{1}$ and $D_{2}$.

1. Assume $D_{1} \xrightarrow{s:=N} \xrightarrow{\tau(s)} D_{1}^{\prime}$ with $\operatorname{var}(N) \subseteq \operatorname{dom}\left(D_{1}\right)$. We only detail the proof for the case that $s$ is an unlocked public cell in $D_{1}$. The analysis for the case when $s$ is locked or bound is similar. Cell name $s$ comes either from context, i.e. $s \in \operatorname{dom}(S)$, or from process $A_{1}$, i.e. $s \in \operatorname{dom}\left(S_{1}\right)$.
(a) Assume $s$ comes from the context, i.e., $S=S^{\prime} \cup\{s \mapsto M\}$.Then

$$
\begin{aligned}
D_{1} & =\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\varphi_{1}^{e}, S^{\prime} \sigma_{1} \cup\left\{s \mapsto M \sigma_{1}\right\} \cup S_{1}, \mathcal{P} \sigma_{1} \cup \mathcal{P}_{1}\right) \\
& \xrightarrow{s:=N} \nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\varphi_{1}^{e}, S^{\prime} \sigma_{1} \cup\left\{s \mapsto N \varphi_{1}^{e}\right\} \cup S_{1}, \mathcal{P} \sigma_{1} \cup \mathcal{P}_{1}\right) \xrightarrow{\tau(s)} D_{1}^{\prime}
\end{aligned}
$$

We shall discuss the different cases of $\tau(s)$. Because $s$ is a unlocked public cell, $\tau(s)$ can be locking the cell $s$, or reading the cell $s$, or writing a term to the cell $s$. Since $s$ is from the context, these actions should also come from the processes in the context, i.e., from $\mathcal{P}$.
i. if $\mathcal{P}=\mathcal{P}^{\prime} \cup\{($ lock $s . P, L)\}$, then $D_{1}^{\prime}=\nu \widetilde{n}, \tilde{n}_{1} \cdot\left(\varphi_{1}^{e}, S^{\prime} \sigma_{1} \cup\left\{s \mapsto N \varphi_{1}^{e}\right\} \cup\right.$ $\left.S_{1}, \mathcal{P}^{\prime} \sigma_{1} \cup\left\{\left(P \sigma_{1}, L \cup\{s\}\right)\right\} \cup \mathcal{P}_{1}\right)$. We construct a new evaluation context $\mathcal{C}^{\prime}=$ $\nu \widetilde{n} .\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}-, S^{\prime} \cup\left\{s \mapsto N\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}\right)\right\}-, \mathcal{P}^{\prime} \cup\{(P, L \cup\{s\})\}-\right)$. Since $\operatorname{var}(N) \subseteq \operatorname{dom}\left(\varphi_{1}^{e}\right)$, we have $\operatorname{var}\left(N\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}\right)\right) \subseteq \operatorname{dom}\left(\sigma_{i}, \sigma_{s}^{i}\right)$. We can see that $N \varphi_{i}^{e}=\left(N\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}\right)\right)\left(\sigma_{i} \cup \sigma_{s}^{i}\right)$ for $i=1,2$. We can verify that $D_{1}^{\prime}=\mathcal{C}^{\prime}\left[B_{1}\right]_{\backslash \widetilde{x}, \widetilde{z}_{t}}$ and

$$
\begin{aligned}
& D_{2}=\nu \widetilde{n}, \widetilde{n}_{2} \cdot\left(\varphi_{2}^{e}, S^{\prime} \sigma_{2} \cup\left\{s \mapsto M \sigma_{2}\right\} \cup S_{2}, \mathcal{P} \sigma_{2} \cup \mathcal{P}_{2}\right) \\
& \xrightarrow{s:=N} \nu \widetilde{n}, \widetilde{n}_{2} \cdot\left(\varphi_{2}^{e}, S^{\prime} \sigma_{2} \cup\left\{s \mapsto N \varphi_{2}^{e}\right\} \cup S_{2}, \mathcal{P} \sigma_{2} \cup \mathcal{P}_{2}\right) \xrightarrow{\tau(s)} D_{2}^{\prime}=\mathcal{C}^{\prime}\left[B_{2}\right]_{\backslash \widetilde{x}, \widetilde{z}_{t}}
\end{aligned}
$$

From $B_{1} \approx_{l} B_{2}$ and the construction of $\mathcal{R}$, we have $\left(D_{1}^{\prime}, D_{2}^{\prime}\right) \in \mathcal{R}$.
ii. if $\mathcal{P}=\mathcal{P}^{\prime} \cup\{(\operatorname{read} s$ as $y . P, L)\}$, then $D_{1}^{\prime}=\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\varphi_{1}^{e}, S^{\prime} \sigma_{1} \cup\left\{s \mapsto N \varphi_{1}^{e}\right\} \cup\right.$ $\left.S_{1}, \mathcal{P}^{\prime} \sigma_{1} \cup\left\{\left(\left(P \sigma_{1}\right)\left\{N \varphi_{1}^{e} / y\right\}, L\right)\right\} \cup \mathcal{P}_{1}\right)$. We construct a context $\mathcal{C}^{\prime}=\nu \widetilde{n} .(\sigma \cup$ $\left.\sigma_{r} \cup \widehat{\sigma}-, S^{\prime} \cup\left\{s \mapsto N\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}\right)\right\}-, \mathcal{P}^{\prime} \cup\left\{\left(P\left\{N\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}\right) / y\right\}, L\right)\right\}-\right)$. The rest of analysis is similar to case i .
iii. if $\mathcal{P}=\mathcal{P}^{\prime} \cup\left\{\left(s:=N^{\prime} . P, L\right)\right\}$, then $D_{1}^{\prime}=\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\varphi_{1}^{e}, S^{\prime} \sigma_{1} \cup\left\{s \mapsto N^{\prime} \sigma_{1}\right\} \cup\right.$ $\left.S_{1}, \mathcal{P}^{\prime} \sigma_{1} \cup\left\{\left(P \sigma_{1}, L\right)\right\} \cup \mathcal{P}_{1}\right)$. Let $\mathcal{C}^{\prime}=\nu \widetilde{n} .\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}-, S^{\prime} \cup\left\{s \mapsto N^{\prime}\right\}-, \mathcal{P}^{\prime} \cup\right.$ $\{(P, L)\}-)$. The rest of analysis is similar to case i .
(b) Assume $s$ comes from $A_{i}$ and $S_{i}=S_{i}^{\prime} \cup\left\{s \mapsto M_{i}\right\}$ with $i=1,2$. Then

$$
\begin{aligned}
D_{1} & =\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\varphi_{1}^{e}, S \sigma_{1} \cup S_{1}^{\prime} \cup\left\{s \mapsto \boldsymbol{M}_{\mathbf{1}}\right\}, \mathcal{P} \sigma_{1} \cup \mathcal{P}_{1}\right) \\
& \xrightarrow{s:=N} D_{1}^{\prime}=\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\varphi_{1}^{e}, S \sigma_{1} \cup S_{1}^{\prime} \cup\left\{\boldsymbol{s} \mapsto \boldsymbol{N} \boldsymbol{\varphi}_{\mathbf{1}}^{e}\right\}, \mathcal{P} \sigma_{1} \cup \mathcal{P}_{\mathbf{1}}\right) \\
& \xrightarrow{\tau(s)} D_{1}^{\prime \prime}=\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\varphi_{1}^{e}, S \sigma_{1} \cup S_{1}^{\prime} \cup\left\{\boldsymbol{s} \mapsto \boldsymbol{N}_{\mathbf{1}}\right\}, \mathcal{P} \sigma_{1} \cup \mathcal{P}_{\mathbf{1}}^{\prime}\right)
\end{aligned}
$$

The transition $D_{1}^{\prime} \xrightarrow{\tau(s)} D_{1}^{\prime \prime}$ operates on the cell $s$ which has nothing to do with the context part. So we can have that

$$
\begin{aligned}
& B_{1}=\nu \widetilde{n}_{1} \cdot\left(\varphi_{1}, S_{1}^{\prime} \cup\left\{s \mapsto \boldsymbol{M}_{\mathbf{1}}\right\}, \mathcal{P}_{1}\right) \\
& \quad \xrightarrow{s:=N\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}\right)} C_{1}^{\prime}=\nu \widetilde{n}_{1} \cdot\left(\varphi_{1}, S_{1}^{\prime} \cup\left\{s \mapsto \boldsymbol{s} \boldsymbol{\varphi}_{\mathbf{1}}^{e}\right\}, \mathcal{P}_{\mathbf{1}}\right) \\
& \quad \text { since }\left(N\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}\right)\right) \varphi_{1}=N \varphi_{1}^{e} \\
& \xrightarrow{\tau(s)} C_{1}^{\prime \prime}=\nu \widetilde{n}_{1} \cdot\left(\varphi_{1}, S_{1}^{\prime} \cup\left\{s \mapsto \boldsymbol{M}_{\mathbf{1}}^{\prime}\right\}, \mathcal{P}_{\mathbf{1}}^{\prime}\right)
\end{aligned}
$$

Let $\mathcal{C}^{\prime}=\nu \widetilde{n} .\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}^{-}, S-, \mathcal{P}-\right)$. We can verify that $D_{1}^{\prime \prime}=\mathcal{C}^{\prime}\left[C_{1}^{\prime \prime}\right]_{\backslash x}, \widetilde{z}_{t}$. Since $A_{1} \approx_{l} A_{2}$, there exists $C_{2}^{\prime \prime}$ such that

$$
\begin{aligned}
B_{2} & =\nu \widetilde{n}_{2} \cdot\left(\varphi_{2}, S_{2}^{\prime} \cup\left\{s \mapsto \boldsymbol{M}_{\mathbf{2}}\right\}, \mathcal{P}_{2}\right) \\
& \xrightarrow{s:=N\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}\right)} C_{2}^{\prime}=\boldsymbol{\nu} \widetilde{\boldsymbol{n}}_{\mathbf{2}} \cdot\left(\varphi_{2}, \boldsymbol{S}_{\mathbf{2}}^{\prime} \cup\left\{\boldsymbol{s} \mapsto \boldsymbol{N} \boldsymbol{\varphi}_{\mathbf{2}}^{e}\right\}, \mathcal{P}_{\mathbf{2}}\right) \\
& \quad \text { ince }\left(N\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}\right)\right) \varphi_{2}=N \varphi_{2}^{e}
\end{aligned} \quad \begin{aligned}
& \stackrel{\tau(s)}{\Longrightarrow} C_{2}^{\prime \prime}=\boldsymbol{\nu} \widetilde{\boldsymbol{n}}^{\prime} \cdot\left(\varphi_{2}, \boldsymbol{S}_{\mathbf{2}}^{\prime \prime}, \boldsymbol{P}_{\mathbf{2}}^{\prime}\right)
\end{aligned}
$$

and $C_{1}^{\prime \prime} \approx_{l} C_{2}^{\prime \prime}$. Applying the context $\mathcal{C}^{\prime}$ and removing variables $\widetilde{x}, \widetilde{z}_{t}$,

$$
\begin{aligned}
D_{2}= & \mathcal{C}^{\prime}\left[B_{2}\right]_{\backslash \widetilde{x}, \widetilde{z}_{t}}=\nu \widetilde{n}, \widetilde{n}_{2} \cdot\left(\varphi_{2}^{e}, S \sigma_{2} \cup S_{2}^{\prime} \cup\left\{s \mapsto \boldsymbol{M}_{\mathbf{2}}\right\}, \mathcal{P} \sigma_{2} \cup \mathcal{P}_{2}\right) \\
& \xrightarrow{s:=N} \mathcal{C}^{\prime}\left[C_{2}^{\prime}\right] \backslash \widetilde{x}, \widetilde{z}_{t}=\nu \widetilde{n}, \widetilde{\boldsymbol{n}}_{\mathbf{2}} \cdot\left(\varphi_{2}^{e}, S \sigma_{2} \cup \boldsymbol{S}_{\mathbf{2}}^{\prime} \cup\left\{s \mapsto \boldsymbol{N} \boldsymbol{\varphi}_{2}^{e}\right\}, \mathcal{P} \sigma_{2} \cup \mathcal{P}_{\mathbf{2}}\right) \\
& \stackrel{\tau(s)}{\Longrightarrow} D_{2}^{\prime \prime}=\mathcal{C}^{\prime}\left[C_{2}^{\prime \prime}\right]_{\backslash \widetilde{x}, \widetilde{z}_{t}}=\nu \widetilde{n}, \boldsymbol{\nu} \widetilde{\boldsymbol{n}}^{\prime} \cdot\left(\varphi_{2}^{e}, S \sigma_{2} \cup \boldsymbol{S}_{\mathbf{2}}^{\prime \prime}, \mathcal{P} \sigma_{2} \cup \mathcal{P}_{\mathbf{2}}^{\prime}\right)
\end{aligned}
$$

Since $C_{1}^{\prime \prime} \approx_{l} C_{2}^{\prime \prime}, D_{1}^{\prime \prime}=\mathcal{C}^{\prime}\left[C_{1}^{\prime \prime}\right]_{\backslash \widetilde{x}, \widetilde{z}_{t}}$ and $D_{2}^{\prime \prime}=\mathcal{C}^{\prime}\left[C_{2}^{\prime \prime}\right]_{\backslash \widetilde{x}, \widetilde{z}_{t}}$, by the construction of $\mathcal{R}$, we have $\left(D_{1}^{\prime \prime}, D_{2}^{\prime \prime}\right) \in \mathcal{R}$.
2. Assume $D_{1} \xrightarrow{a(N)} D_{1}^{\prime}$ with $\operatorname{var}(N) \subseteq \operatorname{dom}\left(D_{1}\right)$. The input action comes either from context part or from the process part.
(a) Assume the input action is from the context part, i.e., $\mathcal{P}=\mathcal{P}^{\prime} \cup\{(a(x) . P, L)\}$.

$$
\begin{aligned}
D_{1} & =\nu \widetilde{n}, \tilde{n}_{1} \cdot\left(\varphi_{1}^{e}, S \sigma_{1} \cup S_{1}, \mathcal{P}^{\prime} \sigma_{1} \cup\left\{\left(\boldsymbol{a}(\boldsymbol{x}) \cdot \boldsymbol{P} \boldsymbol{\sigma}_{\mathbf{1}}, L\right)\right\} \cup \mathcal{P}_{1}\right) \\
& \xrightarrow{a(N)} D_{1}^{\prime}=\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\varphi_{1}^{e}, S \sigma_{1} \cup S_{1}, \mathcal{P}^{\prime} \sigma_{1} \cup\left\{\left(\boldsymbol{P} \boldsymbol{\sigma}_{\mathbf{1}}\left\{\boldsymbol{N} \boldsymbol{\varphi}_{1}^{e} / \boldsymbol{x}\right\}, L\right)\right\} \cup \mathcal{P}_{1}\right)
\end{aligned}
$$

We construct a new evaluation context

$$
\mathcal{C}^{\prime}=\nu \widetilde{n} .\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}-, S-, \mathcal{P}^{\prime} \cup\left\{\left(P\left\{N\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}\right) / x\right\}, L\right)\right\}-\right)
$$

We can verify that $\mathcal{C}^{\prime}\left[B_{1}\right]_{\backslash \widetilde{x}, \widetilde{z}_{t}}=D_{1}^{\prime}$ and $D_{2} \xrightarrow{a(N)} D_{2}^{\prime}=\mathcal{C}^{\prime}\left[B_{2}\right]_{\backslash \widetilde{x}, \widetilde{z}_{t}}$. Thus we have $\left(D_{1}^{\prime}, D_{2}^{\prime}\right) \in \mathcal{R}$.
(b) Assume the input action is from the process part, i.e., $\mathcal{P}_{1}=\mathcal{P}_{1}^{\prime} \cup\left\{\left(a(x) . P_{1}, L\right)\right\}$

$$
\begin{aligned}
& D_{1}=\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\varphi_{1}^{e}, S \sigma_{1} \cup S_{1}, \mathcal{P} \sigma_{1} \cup \mathcal{P}_{1}^{\prime} \cup\left\{\left(\boldsymbol{a}(\boldsymbol{x}) \cdot \boldsymbol{P}_{\mathbf{1}}, L\right)\right\}\right) \\
& \quad \stackrel{a(N)}{\longrightarrow} D_{1}^{\prime}=\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\varphi_{1}^{e}, S \sigma_{1} \cup S_{1}, \mathcal{P} \sigma_{1} \cup \mathcal{P}_{1}^{\prime} \cup\left\{\left(\boldsymbol{P}_{\mathbf{1}}\left\{\boldsymbol{N} \boldsymbol{\varphi}_{1}^{e} / \boldsymbol{x}\right\}, L\right)\right\}\right)
\end{aligned}
$$

And we have the input from $B_{1}$ :

$$
\begin{aligned}
B_{1}=\nu \widetilde{n}_{1} \cdot\left(\varphi_{1}, S_{1}, \mathcal{P}_{1}^{\prime} \cup\right. & \left.\left\{\left(\boldsymbol{a}(\boldsymbol{x}) \cdot \boldsymbol{P}_{\mathbf{1}}, L_{1}\right)\right\}\right) \\
\xrightarrow{a\left(N\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}\right)\right)} C_{1}= & \nu \widetilde{n}_{1} \cdot\left(\varphi_{1}, S_{1}, \mathcal{P}_{1}^{\prime} \cup\left\{\left(\boldsymbol{P}_{\mathbf{1}}\left\{\boldsymbol{N} \varphi_{1}^{e} / \boldsymbol{x}\right\}, L_{1}\right)\right\}\right) \\
& \text { since }\left(N\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}\right) \varphi_{1}=N \varphi_{1}^{e}\right.
\end{aligned}
$$

Let $\mathcal{C}^{\prime}=\nu \widetilde{n} .\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}-, S-, \mathcal{P}-\right)$. We can verify that $D_{1}=\mathcal{C}^{\prime}\left[B_{1}\right]_{\backslash \widetilde{x}, \widetilde{z}_{t}}$ and $D_{1}^{\prime}=$ $\mathcal{C}^{\prime}\left[C_{1}\right]_{\backslash \widetilde{x}, \tilde{z}_{t}}$. Since $A_{1} \approx_{l} A_{2}$, we should have the following transitions from $A_{2}$ 's extension $B_{2}$

$$
\begin{aligned}
B_{2} & =\nu \widetilde{n}_{2} \cdot\left(\varphi_{2}, \boldsymbol{S}_{\mathbf{2}}, \boldsymbol{P}_{\mathbf{2}}\right) \\
& \left.\Longrightarrow C_{3}=\nu \widetilde{n}_{2}^{\prime} \cdot\left(\varphi_{2}, \boldsymbol{S}_{\mathbf{2}}^{\prime}, \boldsymbol{\mathcal { P }}_{\mathbf{2}}^{\prime} \cup\left\{\boldsymbol{a}(\boldsymbol{x}) \cdot \boldsymbol{P}_{\mathbf{2}}, L_{2}\right)\right\}\right) \\
& \xrightarrow{a\left(N\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}\right)\right)} C_{4}=\boldsymbol{\nu} \widetilde{\boldsymbol{n}}_{\mathbf{2}}^{\prime}, \widetilde{\boldsymbol{m}} \cdot\left(\varphi_{2}, \boldsymbol{S}_{\mathbf{2}}^{\prime}, \boldsymbol{\mathcal { P }}_{\mathbf{2}}^{\prime} \cup\left\{\left(\boldsymbol{P}_{\mathbf{2}}^{\boldsymbol{c}}\left\{\boldsymbol{N} \boldsymbol{\varphi}_{\mathbf{2}}^{e} / \boldsymbol{x}\right\}, L_{2}\right)\right\}\right) \\
& \quad \text { since }\left(N\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}\right) \varphi_{2}=N \varphi_{2}^{e}\right. \\
\Longrightarrow & C_{2}=\boldsymbol{\nu} \widetilde{\boldsymbol{n}}_{\mathbf{2}}^{\prime \prime} \cdot\left(\varphi_{2}, \boldsymbol{S}_{\mathbf{2}}^{\prime \prime}, \boldsymbol{P}_{\mathbf{2}}^{\prime \prime}\right)
\end{aligned}
$$

and $C_{1} \approx_{l} C_{2}$. Applying $\mathcal{C}^{\prime}$ to the transitions $B_{2} \Longrightarrow C_{3}$ and $C_{4} \Longrightarrow C_{2}$ and remove the variables $\widetilde{x}, \widetilde{z}_{t}$, we will get

$$
\begin{aligned}
D_{2} & =\mathcal{C}^{\prime}\left[B_{2}\right]_{\backslash \widetilde{x}, \widetilde{z}_{t}}=\nu \widetilde{n}, \widetilde{\boldsymbol{n}}_{\mathbf{2}} \cdot\left(\varphi_{2}^{e}, S \sigma_{2} \cup \boldsymbol{S}_{\mathbf{2}}, \mathcal{P} \sigma_{2} \cup \mathcal{P}_{\mathbf{2}}\right) \\
& \Longrightarrow \mathcal{C}^{\prime}\left[C_{3}\right]_{\backslash \widetilde{x}, \widetilde{z}_{t}}=\nu \widetilde{n}, \widetilde{\boldsymbol{n}}_{\mathbf{2}}^{\prime} \cdot\left(\varphi_{2}^{e}, S \sigma_{2} \cup \boldsymbol{S}_{\mathbf{2}}^{\prime}, \mathcal{P} \sigma_{2} \cup \boldsymbol{\mathcal { P }}_{\mathbf{2}}^{\prime} \cup\left\{\left(\boldsymbol{a}(\boldsymbol{x}) . \boldsymbol{P}_{\mathbf{2}}, L_{2}\right)\right\}\right) \\
& \stackrel{a(N)}{\longrightarrow} \mathcal{C}^{\prime}\left[C_{4}\right]_{\backslash \widetilde{x}, \widetilde{z}_{t}}=\nu \widetilde{n}, \widetilde{\boldsymbol{n}}_{\mathbf{2}}^{\prime} \cdot\left(\varphi_{2}^{e}, S \sigma_{2} \cup \boldsymbol{S}_{\mathbf{2}}^{\prime}, \mathcal{P} \sigma_{2} \cup \mathcal{P}_{\mathbf{2}}^{\prime} \cup\left\{\left(\boldsymbol{P}_{\mathbf{2}}\left\{\boldsymbol{N} \boldsymbol{\varphi}_{\mathbf{2}}^{\boldsymbol{e}} / \boldsymbol{x}\right\}, L_{2}\right)\right\}\right) \\
& \Longrightarrow D_{2}^{\prime}=\mathcal{C}^{\prime}\left[C_{2}\right]_{\backslash \widetilde{x}, \widetilde{z}_{t}}=\nu \widetilde{n}, \widetilde{\boldsymbol{n}}_{\mathbf{2}}^{\prime \prime}, \widetilde{\boldsymbol{m}} \cdot\left(\varphi_{2}^{e}, S \sigma_{2} \cup \boldsymbol{S}_{\mathbf{2}}^{\prime \prime}, \mathcal{P} \sigma_{2} \cup \boldsymbol{\mathcal { P }}_{\mathbf{2}}^{\prime \prime}\right)
\end{aligned}
$$

Since $D_{1}^{\prime}=\mathcal{C}^{\prime}\left[C_{1}\right]_{\backslash \widetilde{x}, \widetilde{z}_{t}}$ and $D_{2}^{\prime}=\mathcal{C}^{\prime}\left[C_{2}\right]_{\backslash \widetilde{x}, \widetilde{z}_{t}}$ and $C_{1} \approx_{l} C_{2}$, we have $\left(D_{1}^{\prime}, D_{2}^{\prime}\right) \in \mathcal{R}$.
3. Assume $D_{1} \xrightarrow{\nu y . \bar{a}\langle y\rangle} D_{1}^{\prime}$. The output action comes either from context part or from the process part.
(a) When the output comes from the context, assume $\mathcal{P}=\mathcal{P}^{\prime} \cup\{(\bar{a}\langle N\rangle . P, L)\}$.

$$
\begin{aligned}
& D_{1}=\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\varphi_{1}^{e}, S \sigma_{1} \cup S_{1}, \mathcal{P}^{\prime} \sigma_{1} \cup\left\{\left(\overline{\boldsymbol{a}}\left\langle\boldsymbol{N} \boldsymbol{\sigma}_{\mathbf{1}}\right\rangle \cdot \boldsymbol{P} \boldsymbol{\sigma}_{\mathbf{1}}, L\right)\right\} \cup \mathcal{P}_{1}\right) \\
& \xrightarrow{\nu y \cdot \bar{a}\langle y\rangle} D_{1}^{\prime}=\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\varphi_{1}^{e} \cup\left\{\boldsymbol{N} \boldsymbol{\sigma}_{\mathbf{1}} / \boldsymbol{y}\right\}, S \sigma_{1} \cup S_{1}, \mathcal{P}^{\prime} \sigma_{1} \cup\left\{\left(\boldsymbol{P} \boldsymbol{\sigma}_{\mathbf{1}}, L\right)\right\} \cup \mathcal{P}_{1}\right)
\end{aligned}
$$

We construct a new evaluation context $\mathcal{C}^{\prime}=\nu \widetilde{n} \cdot\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma} \cup\{N / y\}-, S-, \mathcal{P}^{\prime} \cup\right.$ $\{(P, L)\}-)$. We can verify that $\mathcal{C}^{\prime}\left[B_{1}\right] \widetilde{x}_{x}, \widetilde{z}_{t}=D_{1}^{\prime}$ and $D_{2} \xrightarrow{\nu y . \bar{a}\langle y\rangle} D_{2}^{\prime}=\mathcal{C}^{\prime}\left[B_{2}\right]_{\backslash \widetilde{x}, \widetilde{z}_{t}}$. Thus we have $\left(D_{1}^{\prime}, D_{2}^{\prime}\right) \in \mathcal{R}$.
(b) When the output comes from the process, assume $\mathcal{P}_{1}=\mathcal{P}_{1}^{\prime} \cup\left\{\left(\bar{a}\left\langle N_{1}\right\rangle . P_{1}, L_{1}\right)\right\}$

$$
\begin{aligned}
D_{1} & =\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\varphi_{1}^{e}, S \sigma_{1} \cup S_{1}, \mathcal{P} \sigma_{1} \cup \mathcal{P}_{1}^{\prime} \cup\left\{\left(\overline{\boldsymbol{a}}\left\langle\boldsymbol{N}_{\mathbf{1}}\right\rangle \cdot \boldsymbol{P}_{\mathbf{1}}, L\right)\right\}\right) \\
& \xrightarrow{\nu y \cdot \bar{a}\langle y\rangle} D_{1}^{\prime}=\nu \widetilde{n}, \widetilde{n}_{1} \cdot\left(\varphi_{1}^{e} \cup\left\{\boldsymbol{N}_{\mathbf{1}} / \boldsymbol{y}\right\}, S \sigma_{1} \cup S_{1}, \mathcal{P} \sigma_{1} \cup \mathcal{P}_{1}^{\prime} \cup\left\{\left(\boldsymbol{P}_{\mathbf{1}}, L_{1}\right)\right\}\right)
\end{aligned}
$$

And we have the output from $B_{1}$ :

$$
\begin{aligned}
& B_{1}=\nu \widetilde{n}_{1} \cdot\left(\varphi_{1}, S_{1}, \mathcal{P}_{1}^{\prime} \cup\left\{\left(\overline{\boldsymbol{a}}\left\langle\boldsymbol{N}_{\mathbf{1}}\right\rangle \cdot \boldsymbol{P}_{\mathbf{1}}, L_{1}\right)\right\}\right) \\
& \xrightarrow{\nu y \cdot \bar{a}\langle y\rangle} C_{1}=\nu \widetilde{n}_{1} \cdot\left(\varphi_{1} \cup\left\{\boldsymbol{N}_{\mathbf{1}} / \boldsymbol{y}\right\}, S_{1}, \mathcal{P}_{1}^{\prime} \cup\left\{\left(\boldsymbol{P}_{\mathbf{1}}, L_{1}\right)\right\}\right)
\end{aligned}
$$

Let $\mathcal{C}^{\prime}=\nu \widetilde{n} .\left(\sigma \cup \sigma_{r} \cup \widehat{\sigma}-, S-, \mathcal{P}-\right)$. We can verify that $D_{1}=\mathcal{C}^{\prime}\left[B_{1}\right]_{\backslash \widetilde{x}, \widetilde{z}_{t}}$ and $D_{1}^{\prime}=$ $\mathcal{C}^{\prime}\left[C_{1}\right]_{\backslash \tilde{x}, \tilde{z}_{t}}$. Since $A_{1} \approx_{l} A_{2}$, for the extension $B_{2}$, we should have

$$
\begin{aligned}
& B_{2}=\boldsymbol{\nu} \widetilde{\boldsymbol{n}}_{\mathbf{2}} \cdot\left(\varphi_{2}, \boldsymbol{S}_{\mathbf{2}}, \boldsymbol{\mathcal { P }}_{\mathbf{2}}\right) \\
& \Longrightarrow C_{3}=\boldsymbol{\nu} \widetilde{\boldsymbol{n}}_{\mathbf{2}}^{\prime} \cdot\left(\varphi_{2}, \boldsymbol{S}_{\mathbf{2}}^{\prime}, \boldsymbol{\mathcal { P }}_{\mathbf{2}}^{\prime} \cup\left\{\left(\overline{\boldsymbol{a}}\left\langle\boldsymbol{N}_{\mathbf{2}}\right\rangle \cdot \boldsymbol{P}_{\mathbf{2}}, L_{2}\right)\right\}\right) \\
& \xrightarrow{\nu y \cdot \bar{a}\langle y\rangle} C_{4}=\boldsymbol{\nu} \widetilde{\boldsymbol{n}}_{\mathbf{2}}^{\prime} \cdot\left(\varphi_{2} \cup\left\{\boldsymbol{N}_{\mathbf{2}} / \boldsymbol{y}\right\}, \boldsymbol{S}_{\mathbf{2}}^{\prime}, \boldsymbol{P}_{\mathbf{2}}^{\prime} \cup\left\{\left(\boldsymbol{P}_{\mathbf{2}}, L_{2}\right)\right\}\right) \\
& \Longrightarrow C_{2}=\boldsymbol{\nu} \widetilde{\boldsymbol{n}}_{\mathbf{2}}^{\prime \prime} \cdot\left(\varphi_{2} \cup\left\{N_{2} / y\right\}, \boldsymbol{S}_{\mathbf{2}}^{\prime \prime}, \boldsymbol{P}_{\mathbf{2}}^{\prime \prime}\right)
\end{aligned}
$$

Applying context $\mathcal{C}^{\prime}$ to the transitions $B_{2} \Longrightarrow C_{3}$ and $C_{4} \Longrightarrow C_{2}$ and remove the variables $\widetilde{x}, \widetilde{z}_{t}$, we will get

$$
\begin{aligned}
D_{2} & =\mathcal{C}^{\prime}\left[B_{2}\right]_{\backslash \widetilde{x}, \widetilde{z}_{t}}=\nu \widetilde{n}, \widetilde{\boldsymbol{n}}_{\mathbf{2}} \cdot\left(\varphi_{2}^{e}, S \sigma_{2} \cup S_{2}, \mathcal{P} \sigma_{2} \cup \mathcal{P}_{\mathbf{2}}\right) \\
& \Longrightarrow \mathcal{C}^{\prime}\left[C_{3}\right]_{\backslash \widetilde{x}, \widetilde{z}_{t}}=\nu \widetilde{n}, \widetilde{\boldsymbol{n}}_{\mathbf{2}}^{\prime} \cdot\left(\varphi_{2}^{e}, S \sigma_{2} \cup S_{2}^{\prime}, \mathcal{P} \sigma_{2} \cup \mathcal{P}_{\mathbf{2}}^{\prime} \cup\left\{\left(\overline{\boldsymbol{a}}\left\langle\boldsymbol{N}_{\mathbf{2}}\right\rangle \cdot \boldsymbol{P}_{\mathbf{2}}, L_{2}\right)\right\}\right) \\
& \xrightarrow{\nu y \cdot \bar{a}\langle y\rangle} \mathcal{C}^{\prime}\left[C_{4}\right]_{\backslash \widetilde{x}, \widetilde{z}_{t}}=\nu \widetilde{n}, \widetilde{\boldsymbol{n}}_{\mathbf{2}}^{\prime} \cdot\left(\varphi_{2}^{e} \cup\left\{\boldsymbol{N}_{\mathbf{2}} / \boldsymbol{y}\right\}, S \sigma_{2} \cup \boldsymbol{S}_{\mathbf{2}}^{\prime}, \mathcal{P} \sigma_{2} \cup \boldsymbol{\mathcal { P }}_{\mathbf{2}}^{\prime} \cup\left\{\left(\boldsymbol{P}_{\mathbf{2}}, L_{2}\right)\right\}\right) \\
& \Longrightarrow D_{2}^{\prime}=\mathcal{C}^{\prime}\left[C_{2}\right]_{\backslash \widetilde{x}, \widetilde{z}_{t}}=\nu \widetilde{n}, \widetilde{\boldsymbol{n}}_{\mathbf{2}}^{\prime \prime} \cdot\left(\varphi_{2}^{e} \cup\left\{N_{2} / y\right\}, S \sigma_{2} \cup \boldsymbol{S}_{\mathbf{2}}^{\prime \prime}, \mathcal{P} \sigma_{2} \cup \boldsymbol{\mathcal { P }}_{\mathbf{2}}^{\prime \prime}\right)
\end{aligned}
$$

Thus we have $\left(D_{1}^{\prime}, D_{2}^{\prime}\right) \in \mathcal{R}$.
(c) The analysis for the other cases when $\alpha$ is $\bar{a}\langle c\rangle$ or $\nu c . \bar{a}\langle c\rangle$ is similar.

Now we proceed to show the completeness of our labelled bisimilarity. Although $A \Downarrow_{a}$ is only defined for output action, we can easily test the existence of an input action $b(x)$ by using evaluation context $\mathcal{C}=(-,-,\{(\bar{e}, \emptyset),(\bar{b} . e)\}-)$ where $e$ is fresh. It is clear that:

Claim $A$ can perform an input on channel $b$ if and only if there exists $B$ such that $\mathcal{C}[A] \Longrightarrow B$ and $B \not W^{2}$.
Hence in the following proof, for notational convenience, we use the traditional notation $A \Downarrow_{\bar{b}}$ when $A \xlongequal{\epsilon} \nu \widetilde{n} .(\sigma, S, \mathcal{P} \cup(\bar{b}\langle M\rangle . P, L))$ with $b \notin \widetilde{n}$, and use $A \Downarrow_{b}$ when $A \xlongequal{\epsilon} \nu \widetilde{n} \cdot(\sigma, S, \mathcal{P} \cup(b(x) . P, L))$ with $b \notin \widetilde{n}$.

We write $A \nVdash \gamma_{1} \cdots, \gamma_{i}, \cdots \gamma_{n}$ if $A \not \gamma_{1} \cdots, A \not \gamma_{i}, \cdots A \not \gamma_{n}$ where $\gamma_{i}$ is either $a_{i}$ or $\bar{a}_{i}$ for some channel name $a_{i}$.

Lemma 39. Assume $A \xrightarrow{\tau} \xrightarrow{t:=N} A^{\prime}$ with $t \in \operatorname{unlocks}(A)$, then $A \xrightarrow{t:=N} \xrightarrow{\tau} A^{\prime}$.

Proof. Since $t$ is an unlocked public state cell in $A$, we can see that $\xrightarrow{\tau}$ defined in Figure 1 is irrelevant to $t$. $\xrightarrow{\tau}$ is only related to locked or restricted cells in $A$. So the conclusion holds obviously.

Corollary 40. Assume $A \Longrightarrow \stackrel{t:=N}{\longrightarrow} A^{\prime}$ with $t \in \operatorname{unlocks}(A)$, then $A \xrightarrow{t:=N} \Longrightarrow A^{\prime}$.

Proof. Recall that $\Longrightarrow$ is a reflexive and transitive closure of $\xrightarrow{\tau}$. We can get this corollary by using Lemma 39 several times.

Proposition 41 (Completeness). If $A \approx B$, then $A \approx_{l} B$.

Proof. We define a relation $\mathcal{R}$ as follows:

$$
\mathcal{R}=\left\{\left(A_{1}, A_{2}\right) \mid A_{i}=\nu \widetilde{n}_{i} \cdot\left(\sigma_{i}, S_{i}, \mathcal{P}_{i}\right) \text { for } i=1,2\right.
$$

there exist pairwise-distinct channel names

$$
\left.\widetilde{a}, \widetilde{b}, \widetilde{c}, \widetilde{\text { read }}, \widetilde{\text { write }}, \widetilde{\operatorname{tag}} \text { such that } \widehat{A}_{1} \approx \widehat{A}_{2}\right\}
$$

where

$$
\widehat{A}_{i}:=\nu \widetilde{c}, \tilde{n}_{i} .\binom{\mathcal{P}_{i} \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{i}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J}}{\sigma_{i \backslash W}, S_{i}, \quad \cup\left\{\begin{array}{l}
\left(\overline{\operatorname{read}}_{s}\left\langle S_{i}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right),  \tag{1}\\
\left(\text { write }_{s}(x) . s:=x \cdot \operatorname{tag}_{s} \cdot \text { unlock } s,\{s\}\right)
\end{array}\right\}_{s \in U}}
$$

with $i=1,2$ and

- $W \subseteq \operatorname{dom}\left(A_{1}\right)$ and $U \subseteq f s\left(A_{1}\right) \backslash \operatorname{locks}\left(A_{1}\right)$;
- $\widetilde{a}, \widetilde{b}, \widetilde{\text { read }}, \widetilde{\text { write }, ~} \widetilde{\operatorname{tag}}$ are pairwise-distinct channel names and are different from $f n\left(A_{1}, A_{2}, \widetilde{c}, \widetilde{n}_{1}, \widetilde{n}_{2}\right)$;
- $\widetilde{c} \cap\left(\widetilde{n}_{1} \cup \widetilde{n}_{2}\right)=\emptyset ;$
- $\widetilde{a}=\left\{a_{w}\right\}_{w \in W}$ and $\widetilde{b}=\left\{b_{j}\right\}_{j \in J}$ and $\widetilde{c}=\left\{c_{j}\right\}_{j \in J}$;
- $\widetilde{\text { read }}=\left\{\text { read }_{s}\right\}_{s \in U}$ and $\widetilde{\text { write }}=\left\{\text { write }_{s}\right\}_{s \in U}$ and $\widetilde{\operatorname{tag}}=\left\{\operatorname{tag}_{s}\right\}_{s \in U}$.

The channel name $\operatorname{tag}_{s}$ is used to mark the moment when the attacker has already changed the value of cell $s$ and before cell $s$ is unlocked. As before, since the object of input $\operatorname{tag}_{s}(x)$ is not important, we omit it and write $t a g_{s}$ for simplicity. Note that $\left(\right.$ write $_{s}(x) . s:=x . \operatorname{tag}_{s}$.unlock $\left.s,\{s\}\right)$ locks the unlocked public state cells from $U$. Although the cells in $U$ are locked, the attacker can still read and write these cells via
$\overline{\operatorname{read}}_{s}\left\langle S_{i}(s)\right\rangle$ and write $(x)$ without unlocking the cells. As a result, all the operations on these cells become visible when comparing transitions in observational equivalence.

We show that $\mathcal{R}$ satisfies all the conditions of Definition 31, i.e., $\mathcal{R} \subseteq \approx_{l}$. Note that this is sufficient for proving $\approx \subseteq \approx_{l}$. Suppose $A_{1} \approx A_{2}$, then we let $W=U=J=\emptyset$ and we have $\left(A_{1}, A_{2}\right) \in \mathcal{R}$. Therefore $A_{1} \approx_{l} A_{2}$.

Assume $A_{1} \mathcal{R} A_{2}$ because of $\widehat{A}_{1} \approx \widehat{A}_{2}$ where $A_{1}, A_{2}, \widehat{A}_{1}, \widehat{A}_{2}$ are defined in above Equation (11). According to Definition 31, first of all, we should extend the extended processes $A_{1}$ and $A_{2}$. Let

$$
\operatorname{esc}\left(A_{1}, A_{2}\right)=U_{1} \cup U_{2}
$$

with $U_{1} \subseteq U$ and $U_{2} \cap U=\emptyset$. Selecting fresh variables $v_{s}$ for each $s \in U_{1} \cup U_{2}$, then we shall do the following extensions:

$$
B_{i}=\nu \widetilde{n}_{i} \cdot\left(\varphi_{i}, S_{i}, \mathcal{P}_{i}\right) \quad \varphi_{i}=\sigma_{i} \cup\left\{S_{i}(s) / v_{s}\right\}_{s \in U_{1} \cup U_{2}} \quad \text { for } i=1,2
$$

We shall prove that $B_{1} \approx_{s} B_{2}$, and if $B_{1} \xrightarrow{\alpha} B_{1}^{\prime}$ (or $B_{1} \xrightarrow{s:=N} \xrightarrow{\tau(s)} B_{1}^{\prime}$ ) then there exists $B_{2}^{\prime}$ such that $B_{2} \xrightarrow{\widehat{\alpha}} B_{2}^{\prime}\left(\right.$ resp. $\left.B_{2} \xrightarrow{s:=N} \xrightarrow{\tau(s)} B_{2}^{\prime}\right)$ and $\left(B_{1}^{\prime}, B_{2}^{\prime}\right) \in \mathcal{R}$.

1. First we need to prove the static equivalence $\boldsymbol{B}_{\mathbf{1}} \boldsymbol{\approx}_{\boldsymbol{s}} \boldsymbol{B}_{\mathbf{2}}$. Assume two terms $M, N$ with $\operatorname{var}(M, N) \subseteq \operatorname{dom}\left(B_{1}\right)$ and $M \varphi_{1}=_{\Sigma} N \varphi_{1}$. We shall prove that $M \varphi_{2}={ }_{\Sigma} N \varphi_{2}$. We can safely assume that $\operatorname{name}(M, N) \cap\left(\widetilde{n}_{1}, \widetilde{n}_{2}\right)=\emptyset$, otherwise we can use $\alpha$ equivalence to change $\widetilde{n}_{1}, \widetilde{n}_{2}$. Since some part of $\varphi_{i}(i=1,2)$ are stored in the output actions $\bar{a}_{w}\left\langle w \sigma_{i}\right\rangle, \overline{\operatorname{read}}_{s}\left\langle S_{i}(s)\right\rangle$ in $\widetilde{A}_{i}$, we need to use corresponding input actions to get these terms. We construct the following evaluation context $\mathcal{C}$ :

$$
\begin{aligned}
\mathcal{C} & =(-,-,\{(\bar{e}, \emptyset),(P, V)\}-) \\
P & =a_{w_{1}}\left(x_{w_{1}}\right) \cdots a_{w_{k}}\left(x_{w_{k}}\right) \cdot \operatorname{read}_{s_{1}}\left(z_{s_{1}}\right) \cdots \operatorname{read}_{s_{n}}\left(z_{s_{n}}\right) .
\end{aligned} \quad \quad \begin{aligned}
& \text { read } s_{n+1} \text { as } z_{s_{n+1}} \cdots \operatorname{read} s_{n+l} \text { as } z_{s_{n+l}} . \text { if } M \rho=N \rho \text { then } e
\end{aligned}
$$

where $\left\{w_{1}, \cdots, w_{k}\right\}=W$, and $\left\{s_{1}, \cdots, s_{n}\right\}=U_{1}$, and $\left\{s_{n+1}, \cdots, s_{n+l}\right\}=U_{2}$, and $V:=\operatorname{unlocks}\left(A_{1}\right) \backslash U$ and $\rho=\left\{x_{w} / w\right\}_{w \in W} \cup\left\{z_{s} / v_{s}\right\}_{s \in U_{1} \cup U_{2}}$ and $e$ is a fresh channel name.
Apply $\mathcal{C}$ to $\widehat{A}_{1}$ and then we can do the following transitions:

$$
\begin{aligned}
& \mathcal{C}\left[\widehat{A}_{1}\right]=\nu \widetilde{c}, \widetilde{n}_{1} \cdot\left(\begin{array}{c}
\mathcal{P}_{1} \cup\left\{\left(\overline{\boldsymbol{a}}_{\boldsymbol{w}}\left\langle\boldsymbol{w} \boldsymbol{\sigma}_{\mathbf{1}}\right\rangle, \emptyset\right)\right\}_{\boldsymbol{w} \in \boldsymbol{W}} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
\sigma_{1 \backslash W}, S_{1}, \quad \cup\left\{\begin{array}{l}
\left(\overline{\boldsymbol{r e a d}}_{\boldsymbol{s}}\left\langle\boldsymbol{S}_{\mathbf{1}}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right), \\
\left(\text { write }_{s}(x) . s:=x . \operatorname{tag}_{s} . \mathrm{unlock} s,\{s\}\right)
\end{array}\right\}_{s \in U} \\
\cup\left\{(\bar{e}, \emptyset),\left(\boldsymbol{P} \boldsymbol{\sigma}_{\mathbf{1} \backslash \boldsymbol{W}}, V\right)\right\}
\end{array}\right) \\
& \Longrightarrow \\
& \nu \widetilde{c}, \widetilde{n}_{1} \cdot\left(\begin{array}{c}
\mathcal{P}_{1} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \cup\{(\overline{\boldsymbol{e}}, \emptyset)\} \\
\sigma_{1 \backslash W}, S_{1}, \quad \cup\left\{\left(\overline{\operatorname{tag}}_{s}, \emptyset\right),\left(\text { write }_{s}(x) . s:=x . \operatorname{tag}_{s} . \text { unlock } s,\{s\}\right)\right\}_{s \in U} \\
\cup\left\{\left(\operatorname{if}\left((\boldsymbol{M} \boldsymbol{\rho}) \boldsymbol{\sigma}_{\mathbf{1} \backslash \boldsymbol{W}}\right) \boldsymbol{\rho}^{\prime}=\left((\boldsymbol{N} \boldsymbol{\rho}) \boldsymbol{\sigma}_{\mathbf{1} \backslash \boldsymbol{W}}\right) \boldsymbol{\rho}^{\prime} \text { then } \boldsymbol{e}, V\right)\right\}
\end{array}\right)
\end{aligned}
$$

$\Longrightarrow D_{1}:=$
$\nu \widetilde{c}, \tilde{n}_{1} \cdot\left(\begin{array}{c}\sigma_{1 \backslash W}, S_{1}, \\ \mathcal{P}_{1} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \cup\{(\mathbf{0}, V)\} \\ \cup\left\{\left(\overline{\operatorname{tag}}_{s}, \emptyset\right),\left(\text { write }_{s}(x) . s:=x . \operatorname{tag}_{s} . \text { unlock } s,\{s\}\right)\right\}_{s \in U}\end{array}\right)$
where $\rho^{\prime}=\left\{w \sigma_{1} / x_{w}\right\}_{w \in W} \cup\left\{S_{1}(s) / z_{s}\right\}_{s \in U_{1} \cup U_{2}}$. The last step is deduced from the fact that $\left((M \rho) \sigma_{1 \backslash W}\right) \rho^{\prime}=M \varphi_{1}$ and $\left((N \rho) \sigma_{1 \backslash W}\right) \rho^{\prime}=N \varphi_{1}$ and $M \varphi_{1}=_{\Sigma} N \varphi_{1}$. It is easy to see that $\mathcal{C}\left[\widehat{A}_{1}\right] \Downarrow_{\bar{a}_{w}, \bar{b}_{j}, \overline{\text { read }}_{s}, \text { write }_{s}, \bar{e}}$ with $w \in W, j \in J, s \in U$, while $D_{1} \Downarrow_{\bar{b}_{j}, w r i t e_{s}}$ with $j \in J, s \in U$ but $D_{1} \Downarrow_{\bar{a}_{w}, \overline{\text { read }}_{s}, \bar{e}}$ for any $w \in W, s \in U$. Since $\widehat{A}_{1} \approx \widehat{A}_{2}$ and $\approx$ is closed by application of evaluation context, we have $\mathcal{C}\left[\widehat{A}_{1}\right] \approx \mathcal{C}\left[\widehat{A}_{2}\right]$. Hence there should exist $D_{2}$ such that $\mathcal{C}\left[\widehat{A}_{2}\right] \stackrel{\epsilon}{\Longrightarrow} D_{2} \approx D_{1}$ and we should have $D_{2} \Downarrow_{\bar{b}_{j}, w r i t e_{s}}$ with $j \in J, s \in U$ and $D_{2} \Downarrow_{\bar{a}_{w}, \overline{r e a d}_{s}, \bar{e}}$ for any $w \in W, s \in U$. The only possibility for $D_{2}$ is that

$$
\begin{aligned}
& \mathcal{C}\left[\widehat{A}_{2}\right] \Longrightarrow \\
& \nu \widetilde{c}, \widetilde{n}_{2}^{\prime} .\left(\begin{array}{c}
\mathcal{P}_{2}^{\prime} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \cup\left\{\left(\overline{\operatorname{tag}}_{s}, \emptyset\right),(\overline{\boldsymbol{e}}, \emptyset)\right\} \\
\sigma_{2 \backslash W}, S_{2}^{\prime}, \quad \cup\left\{\left(\text { write }_{s}(x) . s:=x . \operatorname{tag}_{s} \text {.unlock } s,\{s\}\right)\right\}_{s \in U} \\
\cup\left\{\left(\operatorname{if}\left((\boldsymbol{M} \boldsymbol{\rho}) \boldsymbol{\sigma}_{\mathbf{2} \backslash \boldsymbol{W}}\right) \boldsymbol{\rho}^{\prime \prime}=\left((\boldsymbol{N} \boldsymbol{\rho}) \boldsymbol{\sigma}_{\mathbf{2} \backslash \boldsymbol{W}}\right) \boldsymbol{\rho}^{\prime \prime} \text { then } \boldsymbol{e}, V\right)\right\}
\end{array}\right) \\
& \Longrightarrow D_{2}:= \\
& \nu \widetilde{c}, \widetilde{n}_{2}^{\prime \prime} \cdot\binom{\sigma_{2 \backslash W}, S_{2}^{\prime \prime}, \mathcal{P}_{2}^{\prime \prime} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \cup\left\{\left(\overline{\operatorname{tag}}_{s}, \emptyset\right),(\mathbf{0}, V)\right\}}{\cup\left\{\left(\text { write }_{s}(x) . s:=x . \operatorname{tag}_{s} . \text { unlock } s,\{s\}\right)\right\}_{s \in U}}
\end{aligned}
$$

where $\rho^{\prime \prime}=\left\{w \sigma_{2} / x_{w}\right\}_{w \in W} \cup\left\{S_{2}(s) / z_{s}\right\}_{s \in U_{1} \cup U_{2}}$. We must have $\left((M \rho) \sigma_{2 \backslash W}\right) \rho^{\prime \prime}=_{\Sigma}$ $\left((N \rho) \sigma_{2 \backslash W}\right) \rho^{\prime \prime}$, otherwise we wouldn't be able to consume $\bar{e}$. Similarly we know that $\left((M \rho) \sigma_{2 \backslash W}\right) \rho^{\prime \prime}=M \varphi_{2}$ and $\left((N \rho) \sigma_{2 \backslash W}\right) \rho^{\prime \prime}=N \varphi_{2}$. Hence $M \varphi_{2}=_{\Sigma} N \varphi_{2}$.
2. Now we proceed to prove the behavioural equivalence of $\boldsymbol{B}_{1}$ and $\boldsymbol{B}_{2}$. Without loss of generality, we assume $B_{1} \xrightarrow{\alpha} B_{1}^{\prime}$ (resp. $B_{1} \xrightarrow{s:=N} \xrightarrow{\tau(s)} B_{1}^{\prime}$ ) and prove that there exists $B_{2}^{\prime}$ such that $B_{2} \xrightarrow{\widehat{\alpha}} B_{2}^{\prime}\left(\right.$ resp. $\left.B_{2} \xrightarrow{s:=N} \xrightarrow{\tau(s)} B_{2}^{\prime}\right)$ and $\left(B_{1}^{\prime}, B_{2}^{\prime}\right) \in \mathcal{R}$.
Before we start to analyse the transitions, we need to preprocess $\widehat{A}_{1}$ and $\widehat{A}_{2}$. Recall that $B_{1}$ and $B_{2}$ are the extensions of $A_{1}$ and $A_{2}$. When $B_{1}$ performs some operations on a public cell $s$, then $B_{2}$ is required to mimic these operations by transitions on the same cell $s$ in the definition of labelled bisimilarity. In other words, $B_{2}$ is not allowed to perform any operations on the other public cells which are different from $s$. Therefore, when using observational equivalence between $\widehat{A}_{1}$ and $\widehat{A}_{2}$, we need to make sure the transitions on the cell $s$ from $\widehat{A}_{1}$ are matched with transitions on the same cell $s$. To do this, we need to lock and mark these unlocked cells to prevent operations on them. We
construct the following context $\mathcal{C}_{\text {ext }}$ and apply it to $\widehat{A}_{1}$ and $\widehat{A}_{2}$ :

$$
\left.\begin{array}{rl}
\mathcal{C}_{\text {ext }}: & = \\
& \left\{\left(\bar{e}_{s}, \emptyset\right),\left(\text { read }_{s}(z) \cdot\left(\overline{\operatorname{read}}_{s}\langle z\rangle \mid e_{s} \cdot \bar{a}_{v_{s}}\langle z\rangle\right), \emptyset\right)\right\}_{s \in U_{1}} \\
& \cup\left\{\begin{array}{l}
\left(\bar{e}_{s}, \emptyset\right),\left(d_{s}(z) \cdot\left(\overline{\operatorname{read}}_{s}\langle z\rangle \mid e_{s} \cdot \bar{a}_{v_{s}}\langle z\rangle\right), \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right), \\
\left(\mathrm{read} s \text { as } y \cdot \bar{d}_{s}\langle y\rangle \cdot \text { write }_{s}(x) \cdot s:=x \cdot \text { tag }_{s} \cdot \text { unlock } s,\{s\}\right)
\end{array}\right\}_{s \in U_{2}-}- \\
& \cup\left\{\begin{array}{l}
\left(d_{s}(z) \cdot \overline{\operatorname{read}}_{s}\langle z\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right), \\
\left(\mathrm{read} s \text { as } y \cdot \bar{d}_{s}\langle y\rangle \cdot \text { write }_{s}(x) \cdot s:=x \cdot \operatorname{tag}_{s} \cdot \text { unlock } s,\{s\}\right)
\end{array}\right\}_{s \in U_{3}}
\end{array}\right) .
$$

where $U_{3}:=\operatorname{unlocks}\left(A_{1}\right) \backslash\left(U \cup U_{2}\right)$, and $\left\{a_{v_{s}}\right\}_{s \in U_{1} \cup U_{2}}$ and $\left\{d_{s}, \operatorname{tag}_{s}\right\}_{s \in U_{2} \cup U_{3}}$ and $\left\{e_{s}\right\}_{s \in \text { unlocks }\left(A_{1}\right)}$ are fresh pairwise-distinct channel names. Since the cells in $s \in U_{1}$ are already locked and marked in $\widehat{A}_{1}$ and $\widehat{A}_{2}$, the context $\mathcal{C}_{\text {ext }}$ reads their values and store them in the output $\bar{a}_{v_{s}}\langle z\rangle$. The cells in $s \in U_{2}$ are not yet locked and their values are not in the substitutions, so the context $\mathcal{C}_{\text {ext }}$ locks these cells and store their values in the output $\bar{a}_{v_{s}}\langle z\rangle$. The values of cells $s \in U_{3}$ are already stored in the substitutions, so the context $\mathcal{C}_{\text {ext }}$ only locks and marks these cells. The use of $\left(\bar{e}_{s}, \emptyset\right)$ for $s \in U_{1} \cup U_{2}$ is to make sure the parallel composition $\left\{\left(\overline{\text { read }}_{s}\langle z\rangle \mid e_{s} \cdot \bar{a}_{v_{s}}\langle z\rangle, \emptyset\right)\right\}$ will be split into $\left\{\left(\overline{r e a d}_{s}\langle z\rangle, \emptyset\right),\left(\bar{a}_{v_{s}}\langle z\rangle, \emptyset\right)\right\}$ as a result of the communication between $\bar{e}_{s}$ and $e_{s}$.
Since $\approx$ is closed under the application of evaluation contexts, we have $\mathcal{C}_{\text {ext }}\left[\widehat{A}_{1}\right] \approx$ $\mathcal{C}_{\text {ext }}\left[\widehat{A}_{2}\right]$. Then we can have the following transitions:

$$
\begin{aligned}
& \mathcal{C}_{\text {ext }}\left[\widehat{A}_{1}\right]= \\
& \nu \widetilde{c}, \widetilde{n}_{1} \text {. }
\end{aligned}
$$

$$
\begin{aligned}
& = \\
& \nu \widetilde{c}, \widetilde{n}_{1} .
\end{aligned}
$$

$$
\begin{aligned}
& \Longrightarrow D_{1}:= \\
& \nu \widetilde{c}, \widetilde{n}_{1} \cdot\left(\begin{array}{rl}
\mathcal{P}_{1} & \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{1}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
\cup & \left\{\left(\bar{a}_{v_{s}}\left\langle S_{1}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\
\sigma_{1 \backslash W}, S_{1}, & \left.\cup\left\{\begin{array}{l}
\left(\overline{\operatorname{read}}_{s}\left\langle\boldsymbol{S}_{\mathbf{1}}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right), \\
\left(\text { write }_{s}(x) . s:=x . \operatorname{tag}_{s} . \text { unlock } s,\{s\}\right)
\end{array}\right\}_{s \in \text { unlocks }\left(A_{1}\right)}\right)
\end{array}\right)
\end{aligned}
$$

We can see that $D_{1} \Downarrow_{\bar{a}_{w}, \bar{a}_{w_{s}}, \bar{b}_{j}, \overline{\text { read }}_{t}, \text { write }_{t}, \overline{t a g}_{t}}$ for $w \in W, j \in J, s \in U_{1} \cup U_{2}, t \in$ $\operatorname{unlocks}\left(A_{1}\right)$, while $D_{1} \mathbb{Z}_{\bar{e}_{s}, d_{t}}$ for $s \in U_{1} \cup U_{2}, t \in U_{3}$. Since $\mathcal{C}_{\text {ext }}\left[\widehat{A}_{1}\right] \approx \mathcal{C}_{\text {ext }}\left[\widehat{A}_{2}\right]$, there exists $D_{2}$ such that $\mathcal{C}_{\text {ext }}\left[\widehat{A}_{2}\right] \stackrel{\epsilon}{\Longrightarrow} D_{2} \approx D_{1}$. The only possibility for $D_{2}$ is that:
$\mathcal{C}_{\text {ext }}\left[\widehat{A}_{2}\right] \Longrightarrow D_{2}:=$
$\nu \widetilde{c}, \widetilde{n}_{2}^{\prime} .\left(\begin{array}{rl}\mathcal{P}_{2}^{\prime} & \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{2}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\ \cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{2}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\ \sigma_{2 \backslash W}, S_{2}^{\prime}, & \cup\left\{\begin{array}{l}\left(\overline{\operatorname{read}}_{s}\left\langle S_{2}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right), \\ \left(\text { write }_{s}(x) . s:=x . \operatorname{tag}_{s} . \text { unlock } s,\{s\}\right)\end{array}\right\}_{s \in \operatorname{unlocks}\left(A_{1}\right)}\end{array}\right)$
for some $S_{2}^{\prime}, \mathcal{P}_{2}^{\prime}$. Since read $_{s}$, write $, e_{s}, \operatorname{tag}_{s}$ in $\mathcal{C}_{\text {ext }}$ are fresh names, they will not interact with $\widehat{A}_{2}$. Moreover all the unlocked public state cells in $\widehat{A}_{2}$ are locked by $\mathcal{C}_{\text {ext }}$, hence the values of these cells won't be changed during the transitions. Thus, we can deduce that

$$
B_{2} \Longrightarrow E:=\nu \widetilde{n}_{2}^{\prime} \cdot\left(\sigma_{2 \backslash W}, S_{2}^{\prime}, \mathcal{P}_{2}^{\prime}\right)
$$

From $B_{1}=\nu \widetilde{n}_{1} \cdot\left(\varphi_{1}, S_{1}, \mathcal{P}_{1}\right)$ and $E=\nu \widetilde{n}_{2}^{\prime} \cdot\left(\varphi_{2}, S_{2}^{\prime}, \mathcal{P}_{2}^{\prime}\right)$ and $D_{1} \approx D_{2}$, we can verify that $\left(B_{1}, E\right) \in \mathcal{R}$.

Now we are ready to analyse each possible transition from $B_{1}$.
(a) Assume

$$
B_{1}=\nu \widetilde{n}_{1} \cdot\left(\varphi_{1}, S_{1}, \mathcal{P}_{1}\right) \xrightarrow{\tau} B_{1}^{\prime}:=\nu \widetilde{n}_{1}^{\prime} \cdot\left(\varphi_{1}, S_{1}^{\prime}, \mathcal{P}_{1}^{\prime}\right)
$$

This internal transition can only involve $\widetilde{n}_{1}, S_{1}, \mathcal{P}_{1}$, thus we can get the following transition from $D_{1}$ :
$D_{1}=$
$\nu \widetilde{c}, \widetilde{n}_{1} \cdot\left(\begin{array}{rl}\mathcal{P}_{\mathbf{1}} & \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{1}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\ \sigma_{1 \backslash W}, \boldsymbol{S}_{\mathbf{1}}, & \cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{1}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\ \cup & \left\{\begin{array}{l}\left(\overline{\operatorname{read}}_{s}\left\langle S_{1}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right), \\ \left(\operatorname{write}_{s}(x) . s:=x . \operatorname{tag}_{s} . \text { unlock } s,\{s\}\right)\end{array}\right\}_{s \in \operatorname{unlocks}\left(A_{1}\right)}\end{array}\right)$
$\xrightarrow{\tau} D_{1}^{\prime}:=$
$\nu \widetilde{c}, \widetilde{n}_{1}^{\prime} \cdot\left(\begin{array}{rl}\mathcal{P}_{\mathbf{1}}^{\prime} \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{1}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\ \sigma_{1 \backslash W}, \boldsymbol{S}_{\mathbf{1}}^{\prime}, & \cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{1}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\ & \cup\left\{\begin{array}{l}\left(\overline{\operatorname{read}}_{s}\left\langle S_{1}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right), \\ \left(\operatorname{write}_{s}(x) . s:=x . \operatorname{tag}_{s} . \operatorname{unlock} s,\{s\}\right)\end{array}\right\}_{s \in \operatorname{unlocks}\left(A_{1}\right)}\end{array}\right)$
We can see that $D_{1}^{\prime} \Downarrow_{\bar{a}_{w}, \bar{a}_{v_{t}}, \bar{b}_{j}, \overline{\text { read }}_{s}, \overline{t a g}_{s}, \text { write }}$ for $w \in W, t \in U_{1} \cup U_{2}, j \in J, s \in$ unlocks $\left(A_{1}\right)$. From $D_{1} \approx D_{2}$, there should exist $D_{2}^{\prime}$ such that $D_{2} \Longrightarrow D_{2}^{\prime} \approx D_{1}^{\prime}$. The only possibility for $D_{2}^{\prime}$ is that
$D_{2}=$
$\nu \widetilde{c}, \widetilde{n}_{2}^{\prime} .\left(\begin{array}{rl}\mathcal{P}_{\mathbf{2}}^{\prime} \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{2}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\ \cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{2}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\ \sigma_{2 \backslash W}, \boldsymbol{S}_{\mathbf{2}}^{\prime}, & \left.\cup\left\{\begin{array}{l}\left(\overline{\operatorname{read}}_{s}\left\langle S_{2}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right), \\ \left(\operatorname{write}_{s}(x) . s:=x . \operatorname{tag}_{s} . \operatorname{unlock} s,\{s\}\right)\end{array}\right\}_{s \in \operatorname{unlocks(A_{1})}}\right)\end{array}\right.$
$\Longrightarrow D_{2}^{\prime}:=$
$\nu \widetilde{c}, \widetilde{n}_{2}^{\prime \prime} .\left(\begin{array}{rl}\mathcal{P}_{2}^{\prime \prime} & \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{2}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\ \cup & \left\{\left(\bar{a}_{v_{s}}\left\langle S_{2}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\ \sigma_{2 \backslash W}, \boldsymbol{S}_{2}^{\prime \prime}, & \cup\left\{\begin{array}{l}\left(\overline{\operatorname{read}}_{s}\left\langle S_{2}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right), \\ \left(\text { write }_{s}(x) . s:=x . \operatorname{tag}_{s} . \text { unlock } s,\{s\}\right)\end{array}\right\}_{s \in \text { unlocks }\left(A_{1}\right)}\end{array}\right)$
The transitions $D_{2} \Longrightarrow D_{2}^{\prime}$ can only involve $\widetilde{n}_{2}^{\prime}, S_{2}^{\prime}, \mathcal{P}_{2}^{\prime}$. Thus we can see that

$$
E=\nu \widetilde{n}_{2}^{\prime} \cdot\left(\varphi_{2}, S_{2}^{\prime}, \mathcal{P}_{2}^{\prime}\right) \Longrightarrow B_{2}^{\prime}:=\nu \widetilde{n}_{2}^{\prime \prime} \cdot\left(\varphi_{2}, S_{2}^{\prime \prime}, \mathcal{P}_{2}^{\prime \prime}\right)
$$

Since $B_{2} \Longrightarrow E$ and $E \Longrightarrow B_{2}^{\prime}$, we have $B_{2} \Longrightarrow B_{2}^{\prime}$. Comparing the construction of $D_{1}^{\prime}\left(\right.$ resp. $\left.D_{2}^{\prime}\right)$ with $B_{1}^{\prime}$ (resp. $B_{2}^{\prime}$ ), we can see that $\left(B_{1}^{\prime}, B_{2}^{\prime}\right) \in \mathcal{R}$.
(b) Assume

$$
\begin{aligned}
B_{1}=\nu \widetilde{n}_{1} \cdot\left(\varphi_{1}, T_{1} \cup\left\{t \mapsto M_{1}\right\}, \mathcal{P}_{1}\right) \xrightarrow{t:=N} & \nu \widetilde{n}_{1} \cdot\left(\varphi_{1}, T_{1} \cup\left\{t \mapsto N \varphi_{1}\right\}, \mathcal{P}_{1}\right) \\
& \xrightarrow{\tau(t)} B_{1}^{\prime}:=\nu \widetilde{n}_{1} \cdot\left(\varphi_{1}, T_{1} \cup\left\{t \mapsto M_{1}^{\prime}\right\}, \mathcal{P}_{1}^{\prime}\right)
\end{aligned}
$$

where $t \notin \widetilde{n}_{1} \cup \operatorname{locks}\left(\mathcal{P}_{1}\right)$ and $S_{1}=T_{1} \cup\left\{t \mapsto M_{1}\right\}$ and $\operatorname{var}(N) \subseteq \operatorname{dom}\left(B_{1}\right)$.
We need to show that there exists $B_{2}^{\prime}$ such that $B_{2} \xrightarrow{t:=N} \xrightarrow{\tau(t)} B_{2}^{\prime}$ and $\left(B_{1}^{\prime}, B_{2}^{\prime}\right) \in \mathcal{R}$.
The idea is to find a $B_{2}^{\prime}$ from $E$ such that $E \xrightarrow{t:=N} \xrightarrow{\tau(t)} B_{2}^{\prime}$ and then use Corollary 40 and $B_{2} \Longrightarrow E$ to get $B_{2} \xrightarrow{t:=N} \Longrightarrow \stackrel{\tau(t)}{\Longrightarrow} B_{2}^{\prime}$.
We construct an evaluation context $\mathcal{C}_{t}$ :
$\mathcal{C}_{t}=\left(-,-,\left\{\left(\prod_{i=1}^{n} \bar{e}_{i}, \emptyset\right),\left(\begin{array}{l}a_{w_{1}}\left(x_{1}\right) \cdots \cdot a_{w_{n}}\left(x_{n}\right) . \\ \left.\left.\left.\operatorname{read}_{t}(x) \cdot \overline{w r i t e}_{t}\langle N \rho\rangle .\left(\prod_{i=1}^{n} e_{i} \cdot \bar{a}_{w_{i}}\left\langle x_{i}\right\rangle\right), \emptyset\right)\right\}-\right)\end{array}\right.\right.\right.$
where $e_{1} \cdots e_{n}$ are pairwise distinct fresh channel names, $\left\{w_{1}, \cdots, w_{n}\right\}=W \cup$ $\left\{v_{s}\right\}_{s \in U_{1} \cup U_{2}}$ and $\rho=\left\{x_{1} / w_{1}, \cdots, x_{n} / w_{n}\right\}$. Applying $\mathcal{C}_{t}$ to $D_{1}$, we can get the following transitions:

$$
\begin{aligned}
& \mathcal{C}_{t}\left[D_{1}\right]= \\
& \nu \widetilde{c}, \widetilde{n}_{1} \text {. } \\
& \left(\begin{array}{rl}
\mathcal{P}_{1} \cup & \left.\cup\left(\bar{a}_{w}\left\langle w \sigma_{1}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
\cup & \left\{\left(\bar{a}_{v_{s}}\left\langle S_{1}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\
\cup & \left\{\begin{array}{l}
\left(\overline{\operatorname{read}}_{s}\left\langle S_{1}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right), \\
\left(\text { write }_{s}(x) \cdot \boldsymbol{s}:=\boldsymbol{x} \cdot \operatorname{tag}_{s} \cdot \text { unlock } s,\{s\}\right)
\end{array}\right\}_{s \in \operatorname{unlocks}\left(A_{1}\right)} \\
\sigma_{1 \backslash W}, T_{1} \cup\left\{t \mapsto \boldsymbol{M}_{\mathbf{1}}\right\}, & \cup\left\{\left(\prod_{i=1}^{n} \bar{e}_{i}, \emptyset\right)\right\} \\
& \cup\left\{\binom{a_{w_{1}}\left(x_{1}\right) \cdot \cdots a_{w_{n}}\left(x_{n}\right) \cdot}{\left.\left.\operatorname{read}_{t}(x) \cdot \overline{w r i t e}_{t}\langle N \rho\rangle \cdot\left(\prod_{i=1}^{n} e_{i} \cdot \bar{a}_{w_{i}}\left\langle x_{i}\right\rangle\right), \emptyset\right)\right\}}\right.
\end{array}\right. \\
& \Longrightarrow D_{1}^{\prime}:= \\
& \nu \widetilde{c}, \widetilde{n}_{1} \text {. }
\end{aligned}
$$

$$
\xrightarrow{\tau(t)}
$$

$$
\nu \widetilde{c}, \widetilde{n}_{1} .
$$

$$
\begin{aligned}
& \left(\begin{array}{ll}
\mathcal{P}_{\mathbf{1}} \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{1}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
\sigma_{1 \backslash W}, T_{1} \cup\left\{t \mapsto N \varphi_{1}\right\}, & \cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{1}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\
& \cup\left\{\begin{array}{l}
\left({\left.\overline{\text { read }_{s}}\left\langle S_{1}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right),}_{\left(\text {write }_{s}(x) . s:=x^{\prime} . \operatorname{tag}_{s} \cdot \text { unlock } s,\{s\}\right)}\right\}_{s \in \text { unlocks }\left(A_{1}\right)}
\end{array}\right\}^{s \neq t}
\end{array}\right. \\
& \xrightarrow{\tau(t)} D_{1}^{\prime \prime}:=
\end{aligned}
$$

$$
\nu \widetilde{c}, \widetilde{n}_{1} .
$$

$$
\left(\begin{array}{rl}
\mathcal{P}_{1}^{\prime} & \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{1}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
& \cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{1}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\
\sigma_{1 \backslash W}, T_{1} \cup\left\{t \mapsto M_{1}^{\prime}\right\}, & \cup\left\{\begin{array}{l}
\left(\overline{\text { read }}_{s}\left\langle S_{1}(s)\right\rangle, \emptyset\right),\left({\left.\overline{\operatorname{tag}_{s}}, \emptyset\right),}_{\left(\text {write }_{s}(x) . s:=x . \text { tag }_{s} \text {.unlock } s,\{s\}\right)}\right\}_{s \in \text { unlocks }\left(A_{1}\right)}
\end{array}\right\}^{s \neq t}
\end{array}\right)
$$

In the above transitions, all the public state cells in $D_{1}$ are locked. We can see that $D_{1}^{\prime} \psi_{\bar{c}_{1}, \ldots, \bar{e}_{n}, \overline{t a g_{t}}}^{t}$. We apply $\mathcal{C}_{t}$ to $D_{2}$. From $\mathcal{C}_{t}\left[D_{1}\right] \approx \mathcal{C}_{t}\left[D_{2}\right]$, there should exist $D_{2}^{\prime}$ such that $\mathcal{C}_{t}\left[D_{2}\right] \xlongequal{\epsilon} D_{2}^{\prime} \xlongequal{\epsilon} D_{2}^{\prime \prime}$ and $D_{2}^{\prime} \approx D_{1}^{\prime}$ and $D_{2}^{\prime \prime} \approx D_{1}^{\prime \prime}$. Let $S_{2}^{\prime}=$ $T_{2} \cup\left\{t \mapsto M_{2}\right\}$. The only possibility for $D_{2}^{\prime}$ and $D_{2}^{\prime \prime}$ is that:

$$
\begin{aligned}
& \mathcal{C}_{t}\left[D_{2}\right]= \\
& \nu \widetilde{c}, \widetilde{n}_{2}^{\prime} \text {. } \\
& \left(\begin{array}{rl}
\mathcal{P}_{\mathbf{2}}^{\prime} & \cup\left\{\left(\bar{a}_{w}\left\langle\sigma_{2}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
& \cup\left\{\left(\bar{a}_{\sigma_{s}}\left\langle S_{2}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{\mathbf{2}}} \\
& \cup\left\{\begin{array}{l}
\left(\text { read }_{s}\left\langle S_{2}(s)\right\rangle, \emptyset\right),\left(\text { tag }_{s}, \emptyset\right), \\
\left(\text { write }_{s}(x) \cdot \boldsymbol{s}:=\boldsymbol{x} \cdot \operatorname{tag}_{s} . \text { unlock } s,\{s\}\right)
\end{array}\right\}_{s \in \text { unlocks }\left(A_{1}\right)} \\
\sigma_{2 \backslash W}, \boldsymbol{T}_{\mathbf{2}} \cup\left\{t \mapsto \boldsymbol{M}_{\mathbf{2}}\right\}, & \cup\left\{\left(\prod_{i=1}^{n} \bar{e}_{i}, \emptyset\right)\right\} \\
& \cup\left\{\binom{a_{w_{1}}\left(x_{1}\right) \cdots a_{w_{n}}\left(x_{n}\right) .}{\left.\left.\operatorname{read}_{t}(x) . \overline{w r i t e}_{t}\langle N \rho\rangle .\left(\prod_{i=1}^{n} e_{i} \cdot \bar{a}_{w_{i}}\left\langle x_{i}\right\rangle\right), \emptyset\right)\right\}}\right.
\end{array}\right.
\end{aligned}
$$

$$
\Longrightarrow D_{2}^{\prime}:=
$$

$\nu \widetilde{c}, \widetilde{n}_{2}^{\prime \prime}$.

$$
\begin{aligned}
& \left(\begin{array}{rl}
\mathcal{P}_{2}^{\prime \prime} & \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{2}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
& \cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{2}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\
\sigma_{2 \backslash W}, T_{2}^{\prime} \cup\left\{t \mapsto \boldsymbol{v}_{\mathbf{2}}\right\}, & \cup\left\{\begin{array}{l}
\left(\operatorname{read}_{3}\left\langle S_{2}(s)\right\rangle, \emptyset\right),\left(\overline{\text { tag }}_{s}, \emptyset\right), \\
\left(\text { write }_{s}(x) . s:=x . \text { tag }_{s} . \text { unlock } s,\{s\}\right)
\end{array}\right\}_{s \in \text { unlocks }\left(A_{1}\right)}^{s \neq t} \\
& \cup\{(\text { unlock } \boldsymbol{t},\{t\})\}
\end{array}\right) \\
& \xrightarrow{\tau(t)} \\
& \nu \widetilde{c}, \widetilde{n}_{2}^{\prime \prime} \text {. } \\
& \left(\begin{array}{rl}
\mathcal{P}_{\mathbf{2}}^{\prime \prime} & \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{2}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
& \cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{2}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\
\sigma_{2 \backslash W}, \boldsymbol{T}_{\mathbf{2}}^{\prime} \cup\left\{\boldsymbol{t} \mapsto \boldsymbol{N} \boldsymbol{\varphi}_{\mathbf{2}}\right\}, & \cup\left\{\begin{array}{l}
\left({\left.\overline{\operatorname{read}_{s}}\left\langle S_{2}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right),}_{\left(\text {write }_{s}(x) . s:=\right.\text { x. tag }}^{s} \text {.unlock } s,\{s\}\right)
\end{array}\right\}_{s \in \text { unlocks }\left(A_{1}\right)}^{s \neq t}
\end{array}\right\}^{s \neq t} \\
& \stackrel{\tau(t)}{\Longrightarrow} D_{2}^{\prime \prime}:=
\end{aligned}
$$

We can see that

$$
E \Longrightarrow \xrightarrow{t:=N} \Longrightarrow \nu \widetilde{n}_{2}^{\prime \prime} \cdot\left(\varphi_{2}, T_{2}^{\prime} \cup\left\{t \mapsto N \varphi_{2}\right\}, \mathcal{P}_{2}^{\prime \prime}\right) \xrightarrow{\tau(t)} B_{2}^{\prime}:=\nu \widetilde{n}_{2}^{\prime \prime \prime} \cdot\left(\varphi_{2}, S_{2}^{\prime \prime}, \mathcal{P}_{2}^{\prime \prime \prime}\right)
$$

From $B_{2} \Longrightarrow E$, we have $B_{2} \Longrightarrow \stackrel{t:=N}{\Longrightarrow} \xlongequal{\tau(t)} B_{2}^{\prime}$. Using Corollary 40 , we know that $B_{2} \xrightarrow{t:=N} \xrightarrow{\tau(t)} B_{2}^{\prime}$. Comparing the constructions of $B_{1}^{\prime}$ (resp. $B_{2}^{\prime}$ ) with $D_{1}^{\prime \prime}$ (resp. $D_{2}^{\prime \prime}$ ), we know that $\left(B_{1}^{\prime}, B_{2}^{\prime}\right) \in \mathcal{R}$.
(c) Assume $B_{1}=\nu \widetilde{n}_{1}, r .\left(\varphi_{1}, T_{1} \cup\{r \mapsto M\}, \mathcal{Q}_{1} \cup\{(\right.$ open $\left.r . P, L)\}\right) \xrightarrow{\tau(r)} B_{1}^{\prime}:=$ $\nu \widetilde{n}_{1} \cdot(\sigma, S \cup\{r \mapsto M\}, \mathcal{P} \cup\{(P, L)\})$ if $r \notin \widetilde{n}_{1}$.

We can get the following transition from $D_{1}$ :
$D_{1}=$
$\nu \widetilde{c}, \widetilde{n}_{1}, \boldsymbol{r}$.

$$
\begin{aligned}
& \left.\begin{array}{rl}
\mathcal{Q}_{1} & \cup\{(\text { open } \boldsymbol{r} . \boldsymbol{P}, \boldsymbol{L})\} \\
& \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{1}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
\sigma_{1 \backslash W}, T_{1} \cup\{r \mapsto M\}, & \cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{1}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\
& \cup\left\{\begin{array}{l}
\left(\overline{\operatorname{read}}_{s}\left\langle S_{1}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right), \\
\left(\text { write }_{s}(x) . s:=x . \operatorname{tag}_{s} . \text { unlock } s,\{s\}\right)
\end{array}\right\}_{s \in \text { unlocks }\left(A_{1}\right)}
\end{array}\right) \\
& \xrightarrow{\tau(r)} D_{1}^{\prime}:=
\end{aligned}
$$

$\nu \widetilde{c}, \widetilde{n}_{1}$.

$$
\left(\begin{array}{rl}
\mathcal{Q}_{1} & \cup\{(P, L)\} \\
& \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{1}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
\sigma_{1 \backslash W}, T_{1} \cup\{r \mapsto M\}, & \cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{1}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\
& \cup\left\{\begin{array}{l}
\left(\overline{\operatorname{read}}_{s}\left\langle S_{1}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right), \\
\left(\text { write }_{s}(x) . s:=x . \text { tag }_{s} . \text { unlock } s,\{s\}\right)
\end{array}\right\}_{s \in \text { unlocks }\left(A_{1}\right)}
\end{array}\right)
$$

We can see that $D_{1}^{\prime} \Downarrow_{\bar{a}_{w}, \bar{a}_{v_{t}}, \bar{b}_{j}, \overline{\text { read }}_{s}, \overline{\text { tag }}_{s}, \text { write }}$ for $w \in W, t \in U_{1} \cup U_{2}, j \in J, s \in$ $\operatorname{unlocks}\left(A_{1}\right)$. We can also see that $f_{s}\left(D_{1}^{\prime}\right)=f_{s}\left(D_{1}\right) \cup\{r\}$. From $D_{1} \approx D_{2}$, there should exist $D_{2}^{\prime}$ such that $D_{2} \Longrightarrow D_{2}^{\prime} \approx D_{1}^{\prime}$ which requires $f s\left(D_{2}^{\prime}\right)=f_{s}\left(D_{2}\right) \cup\{r\}$. The only possibility for $D_{2}^{\prime}$ is that

$$
D_{2}=
$$

$$
\nu \widetilde{c}, \widetilde{\boldsymbol{n}}_{\mathbf{2}}^{\prime} \cdot\left(\begin{array}{c}
\mathcal{P}_{\mathbf{2}}^{\prime} \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{2}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
\cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{2}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\
\sigma_{2 \backslash W}, \boldsymbol{S}_{\mathbf{2}}^{\prime}, \\
\left.\cup\left\{\begin{array}{l}
\left(\overline{\operatorname{read}}_{s}\left\langle S_{2}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right), \\
\left(\text { write }_{s}(x) . s:=\text { x.tag } . \operatorname{unlock} s,\{s\}\right)
\end{array}\right\}_{s \in \operatorname{unlocks}\left(A_{1}\right)}\right)
\end{array}\right.
$$

$$
\stackrel{\tau(r)}{\Longrightarrow} D_{2}^{\prime}:=
$$

$$
\nu \widetilde{c}, \widetilde{\boldsymbol{n}}_{\mathbf{2}}^{\prime \prime} \cdot\left(\begin{array}{rl}
\mathcal{P}_{\mathbf{2}}^{\prime \prime} & \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{2}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
\cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{2}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\
\sigma_{2 \backslash W}, \boldsymbol{S}_{\mathbf{2}}^{\prime \prime}, & \left.\cup\left\{\begin{array}{l}
\left(\overline{\operatorname{read}}_{s}\left\langle S_{2}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right), \\
\left(\text { write }_{s}(x) . s:=x . \text { tag }_{s} . \text { unlock } s,\{s\}\right)
\end{array}\right\}_{s \in \text { unlocks }\left(A_{1}\right)}\right)
\end{array}\right)
$$

The transitions $D_{2} \Longrightarrow D_{2}^{\prime}$ can only involve $\widetilde{n}_{2}^{\prime}, S_{2}^{\prime}, \mathcal{P}_{2}^{\prime}$. Thus we can see that

$$
E=\nu \widetilde{n}_{2}^{\prime} \cdot\left(\varphi_{2}, S_{2}^{\prime}, \mathcal{P}_{2}^{\prime}\right) \stackrel{\tau(r)}{\Longrightarrow} B_{2}^{\prime}:=\nu \widetilde{n}_{2}^{\prime \prime} \cdot\left(\varphi_{2}, S_{2}^{\prime \prime}, \mathcal{P}_{2}^{\prime \prime}\right)
$$

Since lock $\left(D_{1}^{\prime}\right)=$ lock $\left(D_{2}^{\prime}\right)$ and $f s\left(D_{2}^{\prime}\right)=f s\left(D_{2}\right) \cup\{r\}$ and all the unlocked public state cells in $A_{1}$ are locked in both $D_{2}$ and $D_{2}^{\prime}$, we can see that lock $\left(B_{1}^{\prime}\right)=$ lock $\left(B_{2}^{\prime}\right)$ and $f s\left(B_{2}^{\prime}\right)=f s(E) \cup\{r\}=f s\left(B_{1}^{\prime}\right)$. Since $B_{2} \Longrightarrow E$ and $E \Longrightarrow B_{2}^{\prime}$, we have $B_{2} \Longrightarrow B_{2}^{\prime}$. Comparing the construction of $D_{1}^{\prime}\left(\right.$ resp. $\left.D_{2}^{\prime}\right)$ with $B_{1}^{\prime}\left(\right.$ resp. $\left.B_{2}^{\prime}\right)$, we can see that $\left(B_{1}^{\prime}, B_{2}^{\prime}\right) \in \mathcal{R}$.
(d) Assume $B_{1}=\nu \widetilde{n}_{1} \cdot\left(\varphi_{1}, T_{1} \cup\{r \mapsto M\}, \mathcal{Q}_{1} \cup\{(\right.$ unlock $\left.r . P, L \cup\{r\})\}\right) \xrightarrow{\tau(r)}$ $B_{1}^{\prime}:=\nu \widetilde{n}_{1} \cdot(\sigma, S \cup\{r \mapsto M\}, \mathcal{P} \cup\{(P, L)\})$ if $r \notin \widetilde{n}_{1} \cup$ lock $\left(\mathcal{Q}_{1}\right) \cup L$. The analysis is similar as above case.
(e) Assume $B_{1}=\nu \widetilde{n}_{1} \cdot\left(\varphi_{1}, S_{1}, \mathcal{Q}_{1} \cup\left\{\left(a(x) \cdot P_{1}, L_{1}\right)\right\}\right) \xrightarrow{a(M)} B_{1}^{\prime}:=\nu \widetilde{n}_{1} \cdot\left(\varphi_{1}, S_{1}, \mathcal{Q}_{1} \cup\right.$ $\left.\left\{\left(P_{1}\left\{M \varphi_{1} / x\right\}, L_{1}\right)\right\}\right)$ with $\operatorname{name}(a, M) \cap \widetilde{n}_{1}=\emptyset$ and $\operatorname{var}(M) \subseteq \operatorname{dom}\left(\varphi_{1}\right)$ and $\mathcal{P}_{1}=\mathcal{Q}_{1} \cup\left\{\left(a(x) . P_{1}, L_{1}\right)\right\}$.
i. when $a \notin \widetilde{c}$, we construct an evaluation context $\mathcal{C}$ :

$$
\mathcal{C}=\left(-,-,\left\{\left(\prod_{i=1}^{n} \bar{e}_{i}, \emptyset\right),\binom{a_{w_{1}}\left(x_{1}\right) \cdots \cdot a_{w_{n}}\left(x_{n}\right) .}{\bar{a}\langle M \rho\rangle \cdot\left(\prod_{i=1}^{n} e_{i} \cdot \bar{a}_{w_{i}}\left\langle x_{i}\right\rangle\right), \emptyset}\right\}-\right)
$$

where $e_{1} \cdots e_{n}$ are pairwise distinct fresh channel names, $\left\{w_{1}, \cdots, w_{n}\right\}=W \cup$ $\left\{v_{s}\right\}_{s \in U_{1} \cup U_{2}}$ and $\rho=\left\{x_{1} / w_{1}, \cdots, x_{n} / w_{n}\right\}$. Applying $\mathcal{C}$ to $D_{1}$, we can get the following transitions:

$$
\begin{aligned}
& \mathcal{C}\left[D_{1}\right]= \\
& \left\{\begin{aligned}
\mathcal{Q}_{1} & \cup\left\{\left(a(x) \cdot P_{1}, L_{1}\right)\right\} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
& \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{1}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{1}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}}
\end{aligned}\right. \\
& \cup\left\{\begin{array}{l}
\left(\overline{\operatorname{read}}_{s}\left\langle S_{1}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right), \\
\left(\text { write }_{s}(x) \cdot s:=x \cdot \text { tag }_{s} \text {.unlock } s,\{s\}\right)
\end{array}\right\}_{s \in \text { unlocks }\left(A_{1}\right)} \\
& \cup\left\{\left(\prod_{i=1}^{n} \bar{e}_{i}, \emptyset\right)\right\} \\
& \left.\cup\left\{\left(a_{w_{1}}\left(x_{1}\right) \cdots \cdot a_{w_{n}}\left(x_{n}\right) \cdot \bar{a}\langle M \rho\rangle \cdot\left(\prod_{i=1}^{n} e_{i} \cdot \bar{a}_{w_{i}}\left\langle x_{i}\right\rangle\right), \emptyset\right)\right\}\right) \\
& \Longrightarrow \\
& \nu \widetilde{c}, \widetilde{n}_{1} \cdot\left(\begin{array}{rl}
\mathcal{Q}_{1} & \cup\left\{\left(a(x) \cdot P_{1}, L_{1}\right)\right\} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
& \cup\left\{\begin{array}{l}
\left(\overline{\text { read }}_{s}\left\langle S_{1}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right), \\

\end{array}\right\}_{s \in \text { unlocks }\left(A_{1}\right)} \\
\sigma_{1 \backslash W}, S_{1}, & \cup\left\{\left(\prod_{i=1}^{n} \bar{e}_{i}, \emptyset\right)\right\}
\end{array}\right)
\end{aligned}
$$

$\Longrightarrow D_{1}^{\prime}:=$
$\nu \widetilde{c}, \widetilde{n}_{1} \cdot\left(\begin{array}{rl}\mathcal{Q}_{1} & \cup\left\{\left(P_{1}\left\{M \varphi_{1} / x\right\}, L_{1}\right)\right\} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\ & \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{1}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{1}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\ \sigma_{1 \backslash W}, S_{1}, \quad & \cup\left\{\begin{array}{l}\left(\overline{\text { read }}_{s}\left\langle S_{1}(s)\right\rangle, \emptyset\right),\left(\overline{\text { tag }}_{s}, \emptyset\right), \\ \left(\text { writes }_{s}(x) . s:=x . \text { tag }_{s} . \text { unlock } s,\{s\}\right)\end{array}\right\}_{s \in \text { unlocks }\left(A_{1}\right)}\end{array}\right)$
Then we apply $\mathcal{C}$ to $D_{2}$, and from $\mathcal{C}\left[D_{1}\right] \approx \mathcal{C}\left[D_{2}\right]$. There should exist $D_{2}^{\prime}$ such that $\mathcal{C}\left[D_{2}\right] \xlongequal{\epsilon} D_{2}^{\prime}$ and $D_{2}^{\prime} \approx D_{1}^{\prime}$. Since $D_{1}^{\prime} \Downarrow_{\bar{a}_{w}, \bar{a}_{v}, \bar{b}_{j}, \overline{\text { read }}_{t}, \overline{t a g}_{t}, \text { write }_{t}}$ for $w \in$ $W, s \in U_{1} \cup U_{2}, j \in J, t \in \operatorname{unlocks}\left(A_{1}\right)$ and $D_{1}^{\prime} \not \psi_{\bar{c}_{i}}$ for $i=1, \cdots, n$, the only possibility for $D_{2}^{\prime}$ is that

$$
\begin{aligned}
& \mathcal{C}\left[D_{2}\right]= \\
& \widetilde{\nu c}, \widetilde{\boldsymbol{n}}_{\mathbf{2}}^{\prime} \cdot\left(\begin{array}{rl}
\mathcal{P}_{\mathbf{2}}^{\prime} & \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{2}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{2}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\
& \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
& \cup\left\{\left(\overline{\operatorname{read}}_{s}\left\langle S_{2}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right),\right. \\
\left.\left(\text { write }_{s}(x) \cdot s:=\text { x.tag } \cdot \text { unlock } s,\{s\}\right)\right\}_{s \in \text { unlocks }\left(A_{1}\right)} \\
& \cup\left\{\left(\prod_{i=1}^{n} \bar{e}_{i}, \emptyset\right)\right\} \\
\sigma_{2 \backslash W}, \boldsymbol{S}_{\mathbf{2}}^{\prime},
\end{array}\right) \\
& \Longrightarrow
\end{aligned}
$$

$$
\begin{aligned}
& \Longrightarrow D_{2}^{\prime}:=
\end{aligned}
$$

In the transitions $\mathcal{C}\left[D_{2}\right] \Longrightarrow D_{2}^{\prime}$, there is no operation on public state cells in $\operatorname{unlocks}\left(A_{1}\right)$ because these cells are all locked. So we can deduce that
$E=\nu \widetilde{n}_{2}^{\prime} \cdot\left(\varphi_{2}, S_{2}^{\prime}, \mathcal{P}_{2}^{\prime}\right) \Longrightarrow \nu \widetilde{n}_{2}^{\prime \prime} \cdot\left(\varphi_{2}, S_{2}^{\prime \prime}, \mathcal{P}_{2}^{\prime \prime}\right) \stackrel{a(M)}{\Longrightarrow} B_{2}^{\prime}:=\nu \widetilde{n}_{2}^{\prime \prime \prime} \cdot\left(\varphi_{2}, S_{2}^{\prime \prime \prime}, \mathcal{P}_{2}^{\prime \prime \prime}\right)$
From $D_{1}^{\prime \prime} \approx D_{2}^{\prime \prime}$, we have that $\left(B_{1}^{\prime}, B_{2}^{\prime}\right) \in \mathcal{R}$.
ii. when $a=c_{k}$ for some $k \in J$, we construct an evaluation context $\mathcal{C}$ :

$$
\mathcal{C}=\left(-,-,\left\{\left(\prod_{i=1}^{n} \bar{e}_{i}, \emptyset\right),\binom{a_{w_{1}}\left(x_{1}\right) \cdots a_{w_{n}}\left(x_{n}\right) \cdot b_{k}(u) .}{\bar{u}\langle M \rho\rangle .\left(\bar{b}_{k}\langle u\rangle \mid \prod_{i=1}^{n} e_{i} \cdot \bar{a}_{w_{i}}\left\langle x_{i}\right\rangle\right), \emptyset}\right\}-\right)
$$

where $e_{1} \cdots e_{n}$ are pairwise distinct fresh channel names, $\left\{w_{1}, \cdots, w_{n}\right\}=W \cup$ $\left\{v_{s}\right\}_{s \in U_{1} \cup U_{2}}$ and $\rho=\left\{x_{1} / w_{1}, \cdots, x_{n} / w_{n}\right\}$.
(f) Assume
$B_{1}=\nu \widetilde{n}_{1} \cdot\left(\varphi_{1}, S_{1}, \mathcal{Q}_{1} \cup\left\{\left(a(x) \cdot P_{1}, L_{1}\right)\right\}\right) \xrightarrow{a(d)} B_{1}^{\prime}:=\nu \widetilde{n}_{1} \cdot\left(\varphi_{1}, S_{1}, \mathcal{Q}_{1} \cup\left\{\left(P_{1}\{d / x\}, L_{1}\right)\right\}\right)$
with $a, d \notin \widetilde{n}_{1}=\emptyset$ and $\mathcal{P}_{1}=\mathcal{Q}_{1} \cup\left\{\left(a(x) . P_{1}, L_{1}\right)\right\}$.
i. when $a, d \notin \widetilde{c}$, we construct an evaluation context $\mathcal{C}$ :

$$
\mathcal{C}=(-,-,\{(\bar{e}, \emptyset),(\bar{a}\langle d\rangle . e, \emptyset)\}-)
$$

where $e$ is a fresh channel name. Applying $\mathcal{C}$ to $D_{1}$, we can get the following transitions:

$$
\begin{aligned}
& \mathcal{C}\left[D_{1}\right]= \\
& \nu \widetilde{c}, \widetilde{n}_{1} \cdot\left(\begin{array}{rl}
\mathcal{Q}_{1} & \cup\left\{\left(a(x) \cdot P_{1}, L_{1}\right)\right\} \\
& \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{1}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
\cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{1}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\
\sigma_{1 \backslash W}, S_{1}, \quad & \cup\left\{\begin{array}{l}
\left(\overline{\text { read }}_{s}\left\langle S_{1}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right), \\
\left(\text { write }_{s}(x) \cdot s:=\right.\text { x. tag } \\
\text {.unlock } s,\{s\})
\end{array}\right\}_{s \in \operatorname{unlocks}\left(A_{1}\right)} \\
\cup\{(\bar{e}, \emptyset),(\bar{a}\langle d\rangle \cdot e, \emptyset)\}
\end{array}\right) \\
& \Longrightarrow D_{1}^{\prime}:= \\
& \nu \widetilde{c}, \tilde{n}_{1} \cdot\left(\begin{array}{rl}
\mathcal{Q}_{1} & \cup\left\{\left(P_{1}\{d / x\}, L_{1}\right)\right\} \\
& \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{1}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
\sigma_{1 \backslash W}, S_{1}, & \cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{1}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\
\cup\left\{\begin{array}{l}
\left(\overline{r e a d}_{s}\left\langle S_{1}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right), \\
\left(\text { write }_{s}(x) . s:=x . \operatorname{tag}\right. \\
s . \text { unlock } s,\{s\})
\end{array}\right\}_{s \in \text { unlocks }\left(A_{1}\right)}
\end{array}\right)
\end{aligned}
$$

Then we apply $\mathcal{C}$ to $D_{2}$, and from $\mathcal{C}\left[D_{1}\right] \approx \mathcal{C}\left[D_{2}\right]$. There should exist $D_{2}^{\prime}$ such that $\mathcal{C}\left[D_{2}\right] \xlongequal{\epsilon} D_{2}^{\prime}$ and $D_{2}^{\prime} \approx D_{1}^{\prime}$. Since $D_{1}^{\prime} \Downarrow_{\bar{a}_{w}, \bar{a}_{v_{s}}, \bar{b}_{j}, \overline{\text { read }}_{t}, \overline{\text { tag }}_{t}, \text { write }}^{t}$ for $w \in$ $W, s \in U_{1} \cup U_{2}, j \in J, t \in \operatorname{unlocks}\left(A_{1}\right)$ and $D_{1}^{\prime} W_{\bar{e}}$, the only possibility for $D_{2}^{\prime}$
is that

$$
\begin{aligned}

& \nu \widetilde{c}, \widetilde{\boldsymbol{n}}_{\mathbf{2}}^{\prime} .\left(\begin{array}{rl}
\mathcal{P}_{\mathbf{2}}^{\prime} & \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{1}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
& \cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{2}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\
\sigma_{2 \backslash W}, \boldsymbol{S}_{\mathbf{2}}^{\prime}, & \cup\left\{\begin{array}{l}
\left(\overline{\operatorname{read}}_{s}\left\langle S_{2}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right), \\
\left(\text { write }_{s}(x) . s:=x . \operatorname{tag}_{s} . \mathrm{unlock} s,\{s\}\right)
\end{array}\right\}_{s \in \operatorname{unlocks}\left(A_{1}\right)}
\end{array}\right) \\
& \Longrightarrow D_{2}^{\prime}:= \\
& \left.\nu \widetilde{c}, \widetilde{\boldsymbol{n}}_{\mathbf{2}}^{\prime \prime} \cdot\left(\begin{array}{rl}
\mathcal{P}_{\mathbf{2}}^{\prime \prime} & \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{1}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
& \cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{1}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\
\sigma_{2 \backslash W}, \boldsymbol{S}_{\mathbf{2}}^{\prime \prime}, & \cup\left\{\left(\overline{\operatorname{read}}_{s}\left\langle S_{2}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right),\right. \\
\left(\text { write }_{s}(x) . s:=\text { x. tag } . \text { unlock } s,\{s\}\right)
\end{array}\right\}_{s \in \text { unlocks }\left(A_{1}\right)}\right)
\end{aligned}
$$

In the transitions $\mathcal{C}\left[D_{2}\right] \Longrightarrow D_{2}^{\prime}$, there is no operation on public state cells in unlocks $\left(A_{1}\right)$ because these cells are all locked. So we can deduce that

$$
E=\nu \widetilde{n}_{2}^{\prime} \cdot\left(\varphi_{2}, S_{2}^{\prime}, \mathcal{P}_{2}^{\prime}\right) \stackrel{a(d)}{\Longrightarrow} B_{2}^{\prime}:=\nu \widetilde{n}_{2}^{\prime \prime} \cdot\left(\varphi_{2}, S_{2}^{\prime \prime}, \mathcal{P}_{2}^{\prime \prime}\right)
$$

From $B_{2} \Longrightarrow E$, we have $B_{2} \stackrel{a(d)}{\Longrightarrow} B_{2}^{\prime}$. From $D_{1}^{\prime \prime} \approx D_{2}^{\prime \prime}$, we have that $\left(B_{1}^{\prime}, B_{2}^{\prime}\right) \in$ $\mathcal{R}$.
ii. when $a=c_{k}$ for some $k \in J$ and $d \notin \widetilde{c}$, we construct an evaluation context $\mathcal{C}$ :

$$
\mathcal{C}=\left(-,-,\left\{(\bar{e}, \emptyset),\left(b_{k}(u) \cdot \bar{u}\langle d\rangle . e \cdot \bar{b}_{k}\langle u\rangle, \emptyset\right)\right\}-\right)
$$

where $e$ is a fresh channel name. The analysis is similar as above.
iii. when $a \notin \widetilde{c}$ and $d=c_{k}$ for some $k \in J$, we construct an evaluation context $\mathcal{C}$ :

$$
\mathcal{C}=\left(-,-,\left\{(\bar{e}, \emptyset),\left(b_{k}(u) \cdot \bar{a}\langle u\rangle \cdot e \cdot \bar{b}_{k}\langle u\rangle, \emptyset\right)\right\}-\right)
$$

where $e$ is a fresh channel name. The analysis is similar as above.
iv. when $a=d=c_{k}$ for some $k \in J$, we construct an evaluation context $\mathcal{C}$ :

$$
\mathcal{C}=\left(-,-,\left\{(\bar{e}, \emptyset),\left(b_{k}(u) \cdot \bar{u}\langle u\rangle . e \cdot \bar{b}_{k}\langle u\rangle, \emptyset\right)\right\}-\right)
$$

where $e$ is a fresh channel name. The analysis is similar as above.
v. when $a=c_{k}$ and $d=c_{m}$ for some $k, m \in J$ and $k \neq m$, we construct an evaluation context $\mathcal{C}$ :

$$
\mathcal{C}=\left(-,-,\left\{(\bar{e}, \emptyset),\left(b_{k}(u) \cdot b_{m}(v) \cdot \bar{u}\langle v\rangle \cdot\left(e \cdot \bar{b}_{k}\langle u\rangle \mid \bar{b}_{m}\langle v\rangle\right), \emptyset\right)\right\}-\right)
$$

where $e$ is a fresh channel name. The analysis is similar as above.
(g) Assume $B_{1}=\nu \widetilde{n}_{1} \cdot\left(\varphi_{1}, S_{1}, \mathcal{Q}_{1} \cup\left\{\left(\bar{a}\langle d\rangle \cdot P_{1}, L_{1}\right)\right\}\right) \xrightarrow{\bar{a}\langle d\rangle} B_{1}^{\prime}:=\nu \widetilde{n}_{1} \cdot\left(\varphi_{1}, S_{1}, \mathcal{Q}_{1} \cup\right.$ $\left.\left\{\left(P_{1}, L_{1}\right)\right\}\right)$ with $a, d \notin \widetilde{n}_{1}$ and $\mathcal{P}_{1}=\mathcal{Q}_{1} \cup\left\{\left(\bar{a}\langle d\rangle . P_{1}, L_{1}\right)\right\}$.

$$

where $e$ is a fresh channel name. The analysis is similar as above.
(h) Assume $B_{1}=\nu \widetilde{n}_{1}^{\prime}, d \cdot\left(\varphi_{1}, S_{1}, \mathcal{Q}_{1} \cup\left\{\left(\bar{a}\langle d\rangle . P_{1}, L_{1}\right)\right\}\right) \xrightarrow{\nu d \cdot \bar{a}\langle d\rangle} B_{1}^{\prime}:=\nu \widetilde{n}_{1}^{\prime} \cdot\left(\varphi_{1}, S_{1}, \mathcal{Q}_{1} \cup\right.$ $\left.\left\{\left(P_{1}, L_{1}\right)\right\}\right)$ with $a, d \notin \widetilde{n}_{1}^{\prime}$ and $\mathcal{P}_{1}=\mathcal{Q}_{1} \cup\left\{\left(\bar{a}\langle d\rangle . P_{1}, L_{1}\right)\right\}$.
i. when $a \notin \widetilde{c}$, we construct an evaluation context $\mathcal{C}$ :

$$
\mathcal{C}=\left(-,-,\left\{(\bar{e}, \emptyset),\left(a(x) . \text { if } x \in f n\left(B_{1}, B_{2}\right) \text { then } 0 \text { else } e . \bar{b}_{m}\langle x\rangle, \emptyset\right)\right\}-\right)
$$

where $e, b_{m}$ are different fresh channel names. Applying $\mathcal{C}$ to $D_{1}$, we can get the
following transitions:

$$
\begin{aligned}
& \mathcal{C}\left[D_{1}\right]= \\
& \nu \widetilde{c}, \widetilde{n}_{1}^{\prime}, d .\left(\begin{array}{rl}
\mathcal{Q}_{1} & \cup\left\{\left(\bar{a}\langle d\rangle . P_{1}, L_{1}\right),(\bar{e}, \emptyset)\right\} \\
& \cup\left\{\left(a(x) . \text { if } \boldsymbol{x} \in \text { fn }\left(\boldsymbol{B}_{1}, \boldsymbol{B}_{2}\right) \text { then } 0 \text { else } e . \bar{b}_{m}\langle x\rangle, \emptyset\right)\right\} \\
& \cup\left\{\left(\bar{a}_{w}\left\langle\sigma_{1}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
\sigma_{1 \backslash W}, S_{1}, \\
\cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{1}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\
& \cup\left\{\begin{array}{l}
\left(\overline{r e a d}_{s}\left\langle S_{1}(s)\right\rangle, \emptyset\right),\left(\overline{t a g}_{s}, \emptyset\right), \\
\left(\text { write }_{s}(x) . s:=x . \text { tag }_{s} . \text { unlock } s,\{s\}\right)
\end{array}\right\}_{s \in \text { unlocks }\left(A_{1}\right)}
\end{array}\right) \\
& \Longrightarrow D_{1}^{\prime}:= \\
& \nu \widetilde{c}, \widetilde{n}_{1}^{\prime}, d .\left(\begin{array}{rl}
\mathcal{Q}_{1} & \cup\left\{\left(P_{1}, L_{1}\right)\right\} \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{1}\right\rangle, \emptyset\right)\right\}_{w \in W} \\
& \cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{1}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\
& \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \cup\left\{\left(\bar{b}_{m}\langle d\rangle, \emptyset\right)\right\} \\
\sigma_{1 \backslash W}, S_{1}, & \cup\left\{\begin{array}{l}
\left(\overline{\text { read }}_{s}\left\langle S_{1}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right), \\
\left(\text { write }_{s}(x) . s:=\text { x.tag }_{s} . \text { unlock } s,\{s\}\right)
\end{array}\right\}_{s \in \text { unlocks }\left(A_{1}\right)}
\end{array}\right)
\end{aligned}
$$

Then we apply $\mathcal{C}$ to $D_{2}$. Since $\mathcal{C}\left[D_{1}\right] \approx \mathcal{C}\left[D_{2}\right]$, there should exist $D_{2}^{\prime}$ such that $\mathcal{C}\left[D_{2}\right] \xlongequal{\epsilon} D_{2}^{\prime} \approx D_{1}^{\prime}$.
From $D_{1}^{\prime} \Downarrow_{\bar{a}_{w}, \bar{a}_{s}, \bar{b}_{j}, \bar{b}_{m}, \overline{\text { read }}_{t}, \overline{\text { tag }}_{t}, \text { write }}$ for $w \in W, s \in U_{1} \cup U_{2}, j \in J, t \in$ $\operatorname{unlocks}\left(A_{1}\right)$ and $D_{1}^{\prime} \psi_{\epsilon}$, the only possibility of $D_{2}^{\prime}$ is that:

$$
\begin{aligned}
& \mathcal{C}\left[D_{2}\right]= \\
& \nu \widetilde{\boldsymbol{c}}, \widetilde{n}_{2}^{\prime} .\left(\begin{array}{rl}
\mathcal{P}_{2}^{\prime} & \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{2}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
& \cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{2}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\
\sigma_{2 \backslash W}, S_{2}^{\prime}, & \cup\left\{\begin{array}{l}
\left(\overline{\text { read }}_{s}\left\langle S_{2}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right), \\
\left(\text { write }_{s}(x) . s:=x . \operatorname{tag}_{s} . \text { unlock } s,\{s\}\right)
\end{array}\right\}_{s \in \text { unlocks }\left(A_{1}\right)} \\
& \cup\left\{(\bar{e}, \emptyset),\left(a(x) . \text { if } x \in \operatorname{fn}\left(B_{1}, B_{2}\right) \text { then } 0 \text { else } e . \bar{b}_{m}\langle x\rangle, \emptyset\right)\right\}
\end{array}\right) \\
& \Longrightarrow D_{2}^{\prime}:= \\
& \nu \widetilde{c}, \widetilde{n}_{2}^{\prime \prime}, d .\left(\begin{array}{rl}
\mathcal{P}_{2}^{\prime \prime} & \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{2}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
& \cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{2}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\
\sigma_{2 \backslash W}, S_{2}^{\prime \prime}, & \cup\left\{\begin{array}{l}
\left(\text { read }_{s}\left\langle S_{2}(s)\right\rangle, \emptyset\right),\left(\overline{t a g}_{s}, \emptyset\right), \\
\left(\text { write }_{s}(x) . s:=x^{2} . \text { tag }_{s} \text {.Unlock } s,\{s\}\right)
\end{array}\right\}_{s \in \text { unlocks }\left(A_{1}\right)}
\end{array}\right)
\end{aligned}
$$

In the transitions $\mathcal{C}\left[D_{2}\right] \Longrightarrow D_{2}^{\prime}$, there is no operation on public state cells in $\operatorname{unlocks}\left(A_{1}\right)$ because these cells are all locked. So we can deduce that

$$
E=\nu \widetilde{n}_{2}^{\prime} \cdot\left(\varphi_{2}, S_{2}^{\prime}, \mathcal{P}_{2}^{\prime}\right) \stackrel{\nu d . \bar{a} d\rangle}{\Longrightarrow} B_{2}^{\prime}:=\nu \widetilde{n}_{2}^{\prime \prime} \cdot\left(\varphi_{2}, S_{2}^{\prime \prime}, \mathcal{P}_{2}^{\prime \prime}\right)
$$

From $B_{2} \Longrightarrow E$, we have $B_{2} \stackrel{\nu d . \bar{a}\langle d\rangle}{\Longrightarrow} B_{2}^{\prime}$. From $D_{1}^{\prime \prime} \approx D_{2}^{\prime \prime}$, we have that $\left(B_{1}^{\prime}, B_{2}^{\prime}\right) \in \mathcal{R}$.
ii. when $a=c_{k}$ for some $k \in J$ and $d \notin \widetilde{c}$, we construct an evaluation context $\mathcal{C}$ :

$$
\mathcal{C}=\left(-,-,\left\{(\bar{e}, \emptyset),\left(b_{k}(u) . u(x) . \text { if } x \in f n\left(B_{1}, B_{2}\right) \text { then } 0 \text { else }\left(e . \bar{b}_{k}\langle u\rangle \mid \bar{b}_{m}\langle x\rangle\right), \emptyset\right)\right\}-\right)
$$

where $e, b_{m}$ are different fresh channel names. The analysis is similar as above.
(i) Assume $B_{1}=\nu \widetilde{n}_{1} \cdot\left(\varphi_{1}, S_{1}, \mathcal{Q}_{1} \cup\left\{\left(\bar{a}\left\langle M_{1}\right\rangle . P_{1}, L_{1}\right)\right\}\right) \xrightarrow{\nu x \cdot \bar{a}\langle x\rangle} \nu \widetilde{n}_{1} \cdot\left(\varphi_{1} \cup\left\{M_{1} / x\right\}, S_{1}, \mathcal{P} \cup\right.$ $\left.\left\{\left(P_{1}, L_{1}\right)\right\}\right)$ with $a \notin \widetilde{n}_{1}$ and $M_{1}$ is of the base sort and $x$ is fresh.
i. when $a \notin \widetilde{c}$, selecting a fresh channel name $a_{x}$, we construct an evaluation context $\mathcal{C}$ :

$$
\mathcal{C}=\left(-,-,\left\{(\bar{e}, \emptyset),\left(a(z) \cdot e \cdot \bar{a}_{x}\langle z\rangle, \emptyset\right)\right\}-\right)
$$

where $e$ is a fresh channel name. Applying $\mathcal{C}$ to $D_{1}$, we can get the following transitions:

$$
\begin{aligned}
& \mathcal{C}\left[D_{1}\right]= \\
& \nu \widetilde{c}, \tilde{n}_{1} \cdot\left(\begin{array}{rl}
\mathcal{Q}_{1} & \cup\left\{\left(\bar{a}\left\langle M_{1}\right\rangle \cdot P_{1}, L_{1}\right)\right\} \\
& \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{1}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
\cup & \left\{\left(\bar{a}_{v_{s}}\left\langle S_{1}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\
\sigma_{1 \backslash W}, S_{1}, \quad & \left\{\begin{array}{l}
\left(\overline{\operatorname{read}}_{s}\left\langle S_{1}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right), \\
\left(\text { write }_{s}(x) \cdot s:=x \cdot \operatorname{tag}_{s} . \text { unlock } s,\{s\}\right)
\end{array}\right\}_{s \in \operatorname{unlocks}\left(A_{1}\right)} \\
\cup\left\{(\bar{e}, \emptyset),\left(a(z) \cdot e \cdot \bar{a}_{x}\langle z\rangle, \emptyset\right)\right\}
\end{array}\right) \\
& \Longrightarrow D_{1}^{\prime}:= \\
& \nu \widetilde{c}, \widetilde{n}_{1} \cdot\left(\begin{array}{rl}
\mathcal{Q}_{1} & \cup\left\{\left(P_{1}, L_{1}\right)\right\} \\
& \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{1}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
\cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{1}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\
\sigma_{1 \backslash W}, S_{1}, \quad & \left.\left\{\begin{array}{l}
\left(\overline{\operatorname{read}}_{s}\left\langle S_{1}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right), \\
\left(\text { write }_{s}(x) . s:=x . \operatorname{tag}_{s} . \text { unlock } s,\{s\}\right)
\end{array}\right\}_{s \in \operatorname{unlocks}\left(A_{1}\right)}\right) \\
\cup\left\{\left(\bar{a}_{x}\left\langle M_{1}\right\rangle, \emptyset\right)\right\}
\end{array}\right)
\end{aligned}
$$

Then we apply $\mathcal{C}$ to $D_{2}$. Since $\mathcal{C}\left[D_{1}\right] \approx \mathcal{C}\left[D_{2}\right]$, there should exist $D_{2}^{\prime}$ such that $\mathcal{C}\left[D_{2}\right] \stackrel{\epsilon}{\Longrightarrow} D_{2}^{\prime} \approx D_{1}^{\prime}$.
From $D_{1}^{\prime} \Downarrow_{\bar{a}_{w}, \bar{a}_{v_{s}}, \bar{a}_{x}, \bar{b}_{j}, \bar{b}_{m}, \overline{\text { read }}_{t}, \overline{\text { tag }}_{t}, \text { write }}$ for $w \in W, s \in U_{1} \cup U_{2}, j \in J, t \in$
$\operatorname{unlocks}\left(A_{1}\right)$ and $D_{1}^{\prime} \psi_{\bar{e}}$, the only possibility of $D_{2}^{\prime}$ is that:

$$
\begin{aligned}
& \mathcal{C}\left[D_{2}\right]= \\
& \nu \widetilde{\boldsymbol{c}}, \widetilde{\boldsymbol{n}}_{\mathbf{2}}^{\prime} .\left(\begin{array}{rl}
\mathcal{P}_{\mathbf{2}}^{\prime} & \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{2}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
& \cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{2}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\
\sigma_{2 \backslash W}, \boldsymbol{S}_{\mathbf{2}}^{\prime}, \quad \cup & \left\{\begin{array}{l}
\left(\overline{\operatorname{read}}_{s}\left\langle S_{2}(s)\right\rangle, \emptyset\right),\left(\overline{t a g}_{s}, \emptyset\right), \\
\left(\text { write }_{s}(x) . s:=x . \operatorname{tag} .\right. \\
\\
\\
\cup\left\{(\bar{e}, \emptyset),\left(\boldsymbol{a}(\boldsymbol{z}) . e . \bar{a}_{x}\langle z\rangle, \emptyset\right)\right\}
\end{array}\right.
\end{array}\right. \\
& \Longrightarrow D_{2}^{\prime}:= \\
& \nu \widetilde{\boldsymbol{c}}, \widetilde{\boldsymbol{n}}_{\mathbf{2}}^{\prime \prime} \cdot\left(\begin{array}{rl}
\mathcal{P}_{\mathbf{2}}^{\prime \prime} & \cup\left\{\left(\bar{a}_{w}\left\langle w \sigma_{2}\right\rangle, \emptyset\right)\right\}_{w \in W} \cup\left\{\left(\bar{b}_{j}\left\langle c_{j}\right\rangle, \emptyset\right)\right\}_{j \in J} \\
& \cup\left\{\left(\bar{a}_{v_{s}}\left\langle S_{2}(s)\right\rangle, \emptyset\right)\right\}_{s \in U_{1} \cup U_{2}} \\
\sigma_{2 \backslash W}, \boldsymbol{S}_{\mathbf{2}}^{\prime \prime}, & \cup\left\{\begin{array}{l}
\left(\overline{\operatorname{read}}_{s}\left\langle S_{2}(s)\right\rangle, \emptyset\right),\left(\overline{\operatorname{tag}}_{s}, \emptyset\right), \\
\left(\text { write }_{s}(x) . s:=\text { x. tag } . \text { unlock } s,\{s\}\right)
\end{array}\right\}_{s \in \text { unlocks }\left(A_{1}\right)}
\end{array}\right)
\end{aligned}
$$

In the transitions $\mathcal{C}\left[D_{2}\right] \Longrightarrow D_{2}^{\prime}$, there is no operation on public state cells in unlocks $\left(A_{1}\right)$ because these cells are all locked. So we can deduce that

$$
E=\nu \widetilde{n}_{2}^{\prime} \cdot\left(\varphi_{2}, S_{2}^{\prime}, \mathcal{P}_{2}^{\prime}\right) \stackrel{\nu x . \bar{a}\langle x\rangle}{\Longrightarrow} B_{2}^{\prime}:=\nu \widetilde{n}_{2}^{\prime \prime} \cdot\left(\varphi_{2} \cup\left\{M_{2} / x\right\}, S_{2}^{\prime \prime}, \mathcal{P}_{2}^{\prime \prime}\right)
$$

From $B_{2} \Longrightarrow E$, we have $B_{2} \stackrel{\nu x . \bar{a}\langle x\rangle}{\Longrightarrow} B_{2}^{\prime}$. From $D_{1}^{\prime \prime} \approx D_{2}^{\prime \prime}$, we have that $\left(B_{1}^{\prime}, B_{2}^{\prime}\right) \in \mathcal{R}$.
ii. when $a=c_{k}$ for some $k \in J$, selecting a fresh channel name $a_{x}$, we construct an evaluation context $\mathcal{C}$ :

$$
\mathcal{C}=\left(-,-,\left\{(\bar{e}, \emptyset),\left(b_{k}(u) \cdot u(z) \cdot e \cdot \bar{a}_{x}\langle z\rangle, \emptyset\right)\right\}-\right)
$$

where $e$ is a fresh channel name. The analysis is similar as above.
In the presence of public state cells, labelled bisimilarity is both sound and complete with respect to observational equivalence.

Theorem 42 (Coincidence). In the presence of public state cells, $\approx_{l}=\approx$.

Proof. Using Proposition 38 and Proposition 41

## 7. Conclusion

We present a stateful language which is a general extension of applied pi calculus with state cells. We stick to the original definition of observational equivalence [3]
as much as possible to capture the intuition of indistinguishability from the attacker's point of view, while design the labelled bisimilarity to furthest abstract observational equivalence. When all the state cells are private, we prove that observational equivalence coincides with labelled bisimilarity, which implies Abadi-Fournet's theorem in a revised version of applied pi calculus. In the presence of public state cells, we devise a labelled bisimilarity which is proved to coincide with observational equivalence. In future, we plan to develop a compiler for bi-processes with state cells to automatically verify the observational equivalence, extending the techniques of ProVerif.

## Appendix A. Proofs in Section 3.2

Lemma 6 Let $A$ be a closed extended process with only private state cells and $\mathcal{C}=$ $\nu \widetilde{n} .\left(\sigma-, S-, \mathcal{P}_{-}\right)$be a closing evaluation context with only private state cells and $\widetilde{x} \subseteq$ $\operatorname{dom}(A)$.

1. If $A \xrightarrow{c(M \sigma)} B$ with $n a m e(c, M) \cap \widetilde{n}=\emptyset$ and $\operatorname{var}(M) \subseteq \operatorname{dom}(\mathcal{C}[A] \backslash \widetilde{x})$, then $\mathcal{C}[A]_{\backslash \widetilde{x}} \xrightarrow{c(M)} \mathcal{C}[B]_{\backslash \widetilde{x}} ;$
2. If $A \xrightarrow{\alpha} B$ with $n a m e(\alpha) \cap \widetilde{n}=\emptyset$ and $\operatorname{var}(\alpha) \cap \widetilde{x}=\emptyset$, then $\mathcal{C}[A]_{\backslash \widetilde{x}} \xrightarrow{\alpha} \mathcal{C}[B]_{\backslash \widetilde{x}}$ when $\alpha$ is not an input.

## Proof.

1. Assume $A=\nu \widetilde{n}_{a} .\left(\sigma_{a}, S_{a}, \mathcal{P}_{a} \cup\{(c(z) . P, L)\}\right) \xrightarrow{c(M \sigma)} B=\nu \widetilde{n}_{a} \cdot\left(\sigma_{a}, S_{a}, \mathcal{P}_{a} \cup\right.$ $\left.\left\{\left(P\left\{(M \sigma) \sigma_{a} / z\right\}, L\right)\right\}\right)$ where $\widetilde{n} \cap \widetilde{n}_{a}=\emptyset$. Then
$\mathcal{C}[A]_{\backslash \widetilde{x}}=\nu \widetilde{n}, \widetilde{n}_{a} \cdot\left(\sigma \sigma_{a} \cup \sigma_{a \backslash \widetilde{x}}, S \sigma_{a} \cup S_{a}, \mathcal{P} \sigma_{a} \cup \mathcal{P}_{a} \cup\{(c(z) . P, L)\}\right)$

$$
\xrightarrow{c(M)} \nu \widetilde{n}, \widetilde{n}_{a} \cdot\left(\sigma \sigma_{a} \cup \sigma_{a \backslash \tilde{x}}, S \sigma_{a} \cup S_{a}, \mathcal{P} \sigma_{a} \cup \mathcal{P}_{a} \cup\left\{\left(P\left\{M\left(\sigma \sigma_{a} \cup \sigma_{a \backslash \tilde{x}}\right) / z\right\}, L\right)\right\}\right)
$$

$$
=\nu \widetilde{n}, \widetilde{n}_{a} \cdot\left(\sigma \sigma_{a} \cup \sigma_{a \backslash \widetilde{x}}, S \sigma_{a} \cup S_{a}, \mathcal{P} \sigma_{a} \cup \mathcal{P}_{a} \cup\left\{\left(P\left\{(M \sigma) \sigma_{a} / z\right\}, L\right)\right\}\right)=\mathcal{C}[B]_{\backslash \widetilde{x}}
$$

$$
\text { since } \operatorname{var}(M) \subseteq \operatorname{dom}\left(\mathcal{C}[A]_{\backslash \widetilde{x}}\right) \text { and }(M \sigma) \sigma_{a}=M\left(\sigma \sigma_{a} \cup \sigma_{a \backslash \widetilde{x}}\right)
$$

2. When $\alpha$ is not an input, we take lock $s$ and channel output $\bar{b}\langle c\rangle$ as examples. The other cases are quite similar.
(a) Assume $A=\nu \widetilde{n}_{a} \cdot\left(\sigma_{a}, S_{a} \cup\{s \mapsto M\}, \mathcal{P}_{a} \cup\{(\right.$ lock $\left.s . P, L)\}\right) \xrightarrow{\tau} B=\nu \widetilde{n}_{a} \cdot\left(\sigma_{a}, S_{a}\right.$ $\left.\cup\{s \mapsto M\}, \mathcal{P}_{a} \cup\{(P, L \cup\{s\})\}\right)$ where $s \in \widetilde{n}_{a}, s \notin L \cup \operatorname{locks}\left(\mathcal{P}_{a}\right)$ and $\widetilde{n} \cap \widetilde{n}_{a}=\emptyset$.
$\mathcal{C}[A]_{\backslash \widetilde{x}}=\nu \widetilde{n}, \widetilde{n}_{a} \cdot\left(\sigma \sigma_{a} \cup \sigma_{a \backslash \widetilde{x}}, S \sigma_{a} \cup S_{a} \cup\{s \mapsto M\}, \mathcal{P} \sigma_{a} \cup \mathcal{P}_{a} \cup\{(\right.$ lock $\left.s . P, L)\}\right)$
$\xrightarrow{\tau} \nu \widetilde{n}, \widetilde{n}_{a} \cdot\left(\sigma \sigma_{a} \cup \sigma_{a \backslash \widetilde{x}}, S \sigma_{a} \cup S_{a} \cup\{s \mapsto M\}, \mathcal{P} \sigma_{a} \cup \mathcal{P}_{a} \cup\{(P, L \cup\{s\})\}\right)=\mathcal{C}[B]_{\backslash \widetilde{x}}$
because $s \in \widetilde{n}_{a}$ and $s \notin \operatorname{locks}\left(\mathcal{P}, \mathcal{P}_{a}\right) \cup L$.
(b) Assume $A=\nu \widetilde{n}_{a} \cdot\left(\sigma_{a}, S_{a}, \mathcal{P}_{a} \cup\{(\bar{b}\langle c\rangle . P, L)\}\right) \xrightarrow{\bar{b}\langle c\rangle} B=\nu \widetilde{n}_{a} \cdot\left(\sigma_{a}, S_{a}, \mathcal{P}_{a} \cup\right.$ $\{(P, L)\})$ where $b, c \notin \widetilde{n}_{a} \cup \widetilde{n}$ and $\widetilde{n} \cap \widetilde{n}_{a}=\emptyset$.

$$
\begin{aligned}
& \mathcal{C}[A]_{\backslash \widetilde{x}}=\nu \widetilde{n}, \widetilde{n}_{a} \cdot\left(\sigma \sigma_{a} \cup \sigma_{a \backslash \widetilde{x}}, S \sigma_{a} \cup S_{a}, \mathcal{P} \sigma_{a} \cup \mathcal{P}_{a} \cup\{(\bar{b}\langle c\rangle . P, L)\}\right) \\
& \xrightarrow{\bar{b}\langle c\rangle} \nu \widetilde{n}, \widetilde{n}_{a} \cdot\left(\sigma \sigma_{a} \cup \sigma_{a \backslash \widetilde{x}}, S \sigma_{a} \cup S_{a}, \mathcal{P} \sigma_{a} \cup \mathcal{P}_{a} \cup\{(P, L)\}\right)=\mathcal{C}[B]_{\backslash \widetilde{x}}
\end{aligned}
$$

## Appendix B. Proofs in Section 4.2

Lemma 13 Let $A, B$ be two closed pure extended processes. If $B \simeq^{1} A \xrightarrow{\alpha} A^{\prime}$ with $f v(\alpha) \subseteq \operatorname{dom}(A)$ then there exists a closed pure extended process $B^{\prime}$ such that either $B \xrightarrow{\widehat{\alpha}} A^{\prime}$ or $B \xrightarrow{\alpha} B^{\prime} \simeq^{1} A^{\prime}$.

Proof. We discuss the eight different cases for $B \simeq^{1} A$.

1. Assume $B=\nu \widetilde{n}, m .(\sigma, \mathcal{P}) \simeq \nu \widetilde{n} .(\sigma, \mathcal{P})=A$ or $B=\nu \widetilde{n} .(\sigma, \mathcal{P}) \simeq \nu \widetilde{n}, m .(\sigma, \mathcal{P})=$ $A$ with $m \notin f n(\widetilde{n}, \sigma, \mathcal{P})$. Since $m$ is a redundant name, it will not affect any actions from $\mathcal{P}$. Hence $B \xrightarrow{\alpha} A^{\prime}$.
2. Assume $B=\nu \widetilde{n} \cdot(\sigma, \mathcal{P} \cup\{\nu m \cdot P\}) \simeq \nu \widetilde{n}, m \cdot(\sigma, \mathcal{P} \cup\{P\})=A$ with $m \notin$ $f n(\widetilde{n}, \sigma, \mathcal{P})$. Then we have $B \xrightarrow{\tau} A \xrightarrow{\alpha} A^{\prime}$.
3. Assume $B=\nu \widetilde{n}, m \cdot(\sigma, \mathcal{P} \cup\{P\}) \simeq \nu \widetilde{n} \cdot(\sigma, \mathcal{P} \cup\{\nu m \cdot P\})=A$ with $m \notin$ $f n(\widetilde{n}, \sigma, \mathcal{P})$. If $A \xrightarrow{\alpha} A^{\prime}$ is about pulling out name $m$, then $B=A^{\prime}$. For the other cases of $A \xrightarrow{\alpha} A^{\prime}$, we can easily see that $A$ cannot perform any action from $\nu m . P$ and action $\alpha$ is from $\mathcal{P}$, thus there exists $B^{\prime}$ such that $B \xrightarrow{\alpha} B^{\prime} \simeq^{1} A^{\prime}$.
4. Assume $B=\nu \widetilde{n} .(\sigma, \mathcal{P} \cup\{P \mid Q\}) \simeq \nu \widetilde{n} \cdot(\sigma, \mathcal{P} \cup\{P\} \cup\{Q\})=A$. Then we have $B \xrightarrow{\tau} A \xrightarrow{\alpha} A^{\prime}$.
5. Assume $B=\nu \widetilde{n} .(\sigma, \mathcal{P} \cup\{P\} \cup\{Q\}) \simeq \nu \widetilde{n} .(\sigma, \mathcal{P} \cup\{P \mid Q\})=A$. If $A \xrightarrow{\alpha} A^{\prime}$ is about splitting $P \mid Q$, then $B=A^{\prime}$. For the other cases of $A \xrightarrow{\alpha} A^{\prime}$, we can easily see that $A$ cannot perform any action from $P \mid Q$ and action $\alpha$ is from $\mathcal{P}$, thus there exists $B^{\prime}$ such that $B \xrightarrow{\alpha} B^{\prime} \simeq^{1} A^{\prime}$.
6. When the $B \simeq^{1} A$ replaces some terms, we take conditional branch as an example, the other cases are trivial. Assume $B=\nu \widetilde{n} .\left(\sigma\left\{M^{\prime} / z\right\}, \mathcal{P}\left\{M^{\prime} / z\right\} \cup\left\{\right.\right.$ if $M\left\{M^{\prime} / z\right\}=$ $N\left\{M^{\prime} / z\right\}$ then $P\left\{M^{\prime} / z\right\}$ else $\left.\left.Q\left\{M^{\prime} / z\right\}\right\}\right) \simeq \nu \widetilde{n} .\left(\sigma\left\{N^{\prime} / z\right\}, \mathcal{P}\left\{N^{\prime} / z\right\} \cup\right.$ \{if $M\left\{N^{\prime} / z\right\}=N\left\{N^{\prime} / z\right\}$ then $P\left\{N^{\prime} / z\right\}$ else $\left.\left.Q\left\{N^{\prime} / z\right\}\right\}\right)=A$ and $M^{\prime}=_{\Sigma}$ $N^{\prime}$. Since $M\left\{M^{\prime} / z\right\}=_{\Sigma_{\Sigma}} M\left\{N^{\prime} / z\right\}$ and $N\left\{M^{\prime} / z\right\}={ }_{\Sigma} N\left\{N^{\prime} / z\right\}$, we can see that $M\left\{M^{\prime} / z\right\}={ }_{\Sigma} N\left\{M^{\prime} / z\right\}$ iff $M\left\{N^{\prime} / z\right\}=_{\Sigma} N\left\{N^{\prime} / z\right\}$. That is to say $B$ and $A$ will jump to the same branch. We take then branch as an example here. Then $A^{\prime}=\nu \widetilde{n} .\left(\sigma\left\{N^{\prime} / z\right\}, \mathcal{P}\left\{N^{\prime} / z\right\} \cup P\left\{N^{\prime} / z\right\}\right)$. Let $B^{\prime}=\nu \widetilde{n} .\left(\sigma\left\{M^{\prime} / z\right\}, \mathcal{P}\left\{M^{\prime} / z\right\} \cup\right.$ $\left.P\left\{M^{\prime} / z\right\}\right)$. Clearly we have $B \xrightarrow{\tau} B^{\prime} \simeq^{1} A^{\prime}$.

Given a set of cells $S=\left\{s_{1} \mapsto M_{1}, \cdots, s_{n} \mapsto M_{n}\right\}$ and a set of locks $L$, we define the projection $\left.S\right|_{L}$ of $S$ under $L$ to be the set $\{t \mapsto N \mid\{t \mapsto N\} \subseteq S$ and $t \in L\}$.

Lemma 16 Let $A$ be a closed extended process and $f v(\alpha) \subseteq \operatorname{dom}(A)$. If $A \xrightarrow{\alpha} B$ then $\lfloor A\rfloor \xlongequal{\widehat{\alpha}}\lfloor B\rfloor$.

Proof. We only detail the proof for the transitions related to cell name here. The other cases are trivial. The function $\rfloor$ only gathers together the name restrictions of the top level.

1. Assume $A=\nu \widetilde{n} .(\sigma, S, \mathcal{P} \cup\{(s \mapsto M, \emptyset)\}) \xrightarrow{\tau} B=\nu \widetilde{n} .(\sigma, S \cup\{s \mapsto M\}, \mathcal{P})$. Since $A$ is closed, we have that $s \notin \operatorname{locks}(\mathcal{P})$. We can easily see that $\lfloor A\rfloor=\lfloor B\rfloor$ from the definition of encoding in Section 4
2. Assume $A=\nu \widetilde{n} .(\sigma, S \cup\{s \mapsto M\}, \mathcal{P} \cup\{(\operatorname{read} s$ as $x . P, L)\}) \xrightarrow{\tau} B=\nu \widetilde{n} .(\sigma, S \cup$ $\{s \mapsto M\}, \mathcal{P} \cup\{(P\{M / x\}, L)\})$. Since this transition only affects cell $s$, we assume the encoding for the unlocked cells in $S$ is $\mathcal{Q}_{1}$ and the encoding for $\mathcal{P}$ is $\mathcal{Q}_{2}$. We also assume the encoding for names $\widetilde{n}$ is $\widetilde{n}^{\prime}$. The encoding for $\{s \mapsto M\}$ and read $s$ as $x . P$ are different regarding $s$ is locked or not.
(a) if $s \in L$, let $T=\left.S\right|_{L} \cup\{s \mapsto M\}$, then $\lfloor A\rfloor=\nu \widetilde{n}^{\prime} .\left(\sigma, \mathcal{Q}_{1} \cup \mathcal{Q}_{2} \cup\left\{\lfloor P\{M / x\}\rfloor_{T}\right\}\right)$ and $\lfloor B\rfloor=\nu \widetilde{n}^{\prime} .\left(\sigma, \mathcal{Q}_{1} \cup \mathcal{Q}_{2} \cup\left\{\lfloor P\{M / x\}\rfloor_{T}\right\}\right)$. Thus we have $\lfloor A\rfloor \Longrightarrow\lfloor B\rfloor$.
(b) if $s \notin L$, then we have $\lfloor A\rfloor=\nu \widetilde{n}^{\prime} .\left(\sigma, \mathcal{Q}_{1} \cup \mathcal{Q}_{2} \cup\left\{\overline{c_{s}}\langle M\rangle, c_{s}(x) .\left(\overline{c_{s}}\langle x\rangle \mid\lfloor P\rfloor_{\left.S\right|_{L}}\right)\right\}\right.$ ) and $\lfloor B\rfloor=\nu \widetilde{n}^{\prime} .\left(\sigma, \mathcal{Q}_{1} \cup \mathcal{Q}_{2} \cup\left\{\overline{c_{s}}\langle M\rangle,\lfloor P\{M / x\}\rfloor_{\left.S\right|_{L}}\right\}\right)$. Thus $\lfloor A\rfloor \xrightarrow{\tau} \nu \widetilde{n}^{\prime} .\left(\sigma, \mathcal{Q}_{1} \cup\right.$ $\left.\mathcal{Q}_{2} \cup\left\{\overline{c_{s}}\langle M\rangle \mid\lfloor P\{M / x\}\rfloor_{\left.S\right|_{L}}\right\}\right) \xrightarrow{\tau}\lfloor B\rfloor$.
3. Assume $A=\nu \widetilde{n} .(\sigma, S \cup\{s \mapsto M\}, \mathcal{P} \cup\{(s:=N . P, L)\}) \xrightarrow{\tau} B=\nu \widetilde{n} .(\sigma, S \cup$ $\{s \mapsto N\}, \mathcal{P} \cup\{(P, L)\})$. Similar to the read case, we assume the encoding for $\tilde{n}, S, \mathcal{P}$ are $\widetilde{n}^{\prime}, \mathcal{Q}_{1}, \mathcal{Q}_{2}$ respectively.
(a) if $s \in L$, then $\lfloor A\rfloor=\nu \widetilde{n}^{\prime} .\left(\sigma, \mathcal{Q}_{1} \cup \mathcal{Q}_{2} \cup\left\{\lfloor P\rfloor_{\left.S\right|_{L} \cup\{s \mapsto N\}}\right\}\right)$ and $\lfloor B\rfloor=$ $\nu \widetilde{n}^{\prime} .\left(\sigma, \mathcal{Q}_{1} \cup \mathcal{Q}_{2} \cup\left\{\lfloor P\rfloor_{\left.S\right|_{L} \cup\{s \mapsto N\}}\right\}\right)$. This gives us $\lfloor A\rfloor \Longrightarrow\lfloor B\rfloor$.
(b) if $s \notin L$, then $\lfloor A\rfloor=\nu \widetilde{n}^{\prime} .\left(\sigma, \mathcal{Q}_{1} \cup \mathcal{Q}_{2} \cup\left\{\overline{c_{s}}\langle M\rangle, c_{s}(x) .\left(\overline{c_{s}}\langle N\rangle \mid\lfloor P\rfloor_{\left.S\right|_{L}}\right)\right\}\right)$ where $x$ is a fresh base sort variable and $\lfloor B\rfloor=\nu \widetilde{n}^{\prime} .\left(\sigma, \mathcal{Q}_{1} \cup \mathcal{Q}_{2} \cup\left\{\overline{c_{s}}\langle N\rangle,\lfloor P\rfloor_{\left.S\right|_{L}}\right\}\right)$. Thus $\lfloor A\rfloor \xrightarrow{\tau} \nu \widetilde{n}^{\prime} .\left(\sigma, \mathcal{Q}_{1} \cup \mathcal{Q}_{2} \cup\left\{\overline{c_{s}}\langle N\rangle \mid\lfloor P\rfloor_{\left.S\right|_{L}}\right\}\right) \xrightarrow{\tau}\lfloor B\rfloor$.
4. Assume $A=\nu \widetilde{n} .(\sigma, S \cup\{s \mapsto M\}, \mathcal{P} \cup\{($ lock $s . P, L)\}) \xrightarrow{\tau} \nu \widetilde{n} .(\sigma, S \cup\{s \mapsto M\}$, $\mathcal{P} \cup\{(P, L \cup\{s\})\})$ and $s \notin L \cup \operatorname{locks}(\mathcal{P})$. Similar to the read case, we assume the encoding for unlocked cells in $S$ is $\mathcal{Q}_{1}$ and encoding for $\widetilde{n}, \mathcal{P}$ are $\widetilde{n}^{\prime}, \mathcal{Q}_{2}$ respectively. Then $\lfloor A\rfloor=\nu \widetilde{n}^{\prime} .\left(\sigma, \mathcal{Q}_{1} \cup \mathcal{Q}_{2} \cup\left\{\overline{c_{s}}\langle M\rangle, c_{s}(x) .\lfloor P\rfloor_{\left.S\right|_{L} \cup\{s \mapsto x\}}\right\}\right)$ and $\lfloor B\rfloor=$ $\nu \widetilde{n}^{\prime} .\left(\sigma, \mathcal{Q}_{1} \cup \mathcal{Q}_{2} \cup\left\{\lfloor P\rfloor_{\left.S\right|_{L} \cup\{s \mapsto M\}}\right\}\right)$. Since $x \notin f v(P),\lfloor P\rfloor_{\left.S\right|_{L} \cup\{s \mapsto x\}}\{M / x\}=$ $\lfloor P\rfloor_{\left.S\right|_{L} \cup\{s \mapsto M\}}$. Thus we have $\lfloor A\rfloor \xrightarrow{\tau}\lfloor B\rfloor$.
5. Assume $A=\nu \widetilde{n} .(\sigma, S \cup\{s \mapsto M\}, \mathcal{P} \cup\{($ unlock $s . P, L)\}) \xrightarrow{\tau} B=\nu \widetilde{n} .(\sigma, S \cup$ $\{s \mapsto M\}, \mathcal{P} \cup\{(P, L \backslash\{s\})\})$ and $s \in L$. We assume the encoding for $\widetilde{n}, S, \mathcal{P}$ are $\widetilde{n}^{\prime}, \mathcal{Q}_{1}, \mathcal{Q}_{2}$ respectively. Then $\lfloor A\rfloor=\nu \widetilde{n}^{\prime} .\left(\sigma, \mathcal{Q}_{1} \cup \mathcal{Q}_{2} \cup\left\{\overline{c_{s}}\langle M\rangle \mid\lfloor P\rfloor_{\left.S\right|_{L}}\right\}\right)$ and $\lfloor B\rfloor=\nu \widetilde{n}^{\prime} .\left(\sigma, \mathcal{Q}_{1} \cup \mathcal{Q}_{2} \cup\left\{\overline{c_{s}}\langle M\rangle,\lfloor P\rfloor_{\left.S\right|_{L}}\right\}\right)$. Thus $\lfloor A\rfloor \xrightarrow{\tau}\lfloor B\rfloor$.

## Appendix C. Proofs of Theorem 21 and Corollary 22 in Section 5

In this section, we discuss the relation between applied pi calculus and stateful applied pi calculus.

To fix the flaw mentioned in Section 3.1, we revise the original applied pi calculus [3] slightly that the active substitutions are only defined on terms of base sort. Since the communication rule in [3] relies on the active substitutions, we need to replace it with the new rule Comm $\bar{a}\langle M\rangle . P_{r}\left|a(x) . Q_{r} \xrightarrow{\tau} P_{r}\right| Q_{r}\{M / x\}$ accordingly.

To avoid confusion, we use $A_{r}, B_{r}, C_{r}$ to refer to the extended processes and use $\mathcal{C}_{r}$ to refer to the evaluation context in applied pi calculus.

## Appendix C.1. An Alternative Semantics for Applied Pi Calculus

To ease the proof, we use an alternative semantics in Figure C. 6 of the revised applied pi calculus mentioned above. This semantics has been proved in Appendix A in [32] to yield exactly the same set of observational equivalence (resp. labelled bisimilarity) as the one in [3]. For convenience of reading, we copy the proof in [32] here.

The operational semantics of the applied pi calculus relies heavily on structural equivalence. This is because the analysis of complex data and "alias" mechanism introduced in the calculus depends on structural equivalence rules such as SUBST and REWRITE. Unfortunately such a structural equivalence makes the formal reasoning very difficult. Thus, as a first step, we need to preprocess the original semantics in [3] and rewrite it to a more convenient form while preserving the observational equivalence.

Here in Figure C. 6 we replace the two-directional rule $!P_{r} \equiv P_{r} \mid!P_{r}$ in structural equivalence in [3] with the one-directional $!P_{r} \xrightarrow{\tau} P_{r} \mid!P_{r}$ in the internal reduction, as well as replacing the THEN in internal reduction in [3] with if $M=$ $N$ then $P_{r}$ else $Q_{r} \xrightarrow{\tau} P_{r}$ if $M={ }_{\Sigma} N$.

We shall show that the notions of the observational equivalence and the labelled bisimilarity generated by the two sets of rules are exactly the same (Theorem 50 andTheorem 51. . In other words, it is adequate to handle replications with ! $P_{r} \xrightarrow{T}$ $P_{r} \mid!P_{r}$ only.

The observational equivalence and labelled bisimilarity in applied pi calculus are defined by:

Definition 43. Observational equivalence $(\approx)$ is the largest symmetric relation $\mathcal{R}$ between closed extended processes with the same domain such that $A_{r} \mathcal{R} B_{r}$ implies:

1. if $A_{r} \Downarrow_{a}$ then $B_{r} \Downarrow_{a}$;
2. if $A_{r} \Longrightarrow A_{r}^{\prime}$, then $B_{r} \Longrightarrow B_{r}^{\prime}$ and $A_{r}^{\prime} \mathcal{R} B_{r}^{\prime}$ for some $B_{r}^{\prime}$;
3. $\mathcal{C}_{r}\left[A_{r}\right] \mathcal{R} \mathcal{C}_{r}\left[B_{r}\right]$ for all closing evaluation contexts $\mathcal{C}_{r}$.

Definition 44. Two terms $M$ and $N$ are equal in the frame $\phi$, written $(M=N) \phi$, iff $\phi \equiv \nu \widetilde{n} . \sigma,\{\widetilde{n}\} \cap \operatorname{name}(M, N)=\emptyset$, and $M \sigma=_{\Sigma} N \sigma$, for some names $\widetilde{n}$ and substitution $\sigma$.

\end{aligned}
$$

Figure C.6: Operational Semantics of Applied Pi

Two closed frames $\phi_{1}$ and $\phi_{2}$ are statically equivalent, written $\phi_{1} \approx_{s} \phi_{2}$, if dom $\left(\phi_{1}\right)$ $=\operatorname{dom}\left(\phi_{2}\right)$, and for all terms $M$ and $N$ such that $\operatorname{var}(M, N) \subseteq \operatorname{dom}\left(\phi_{1}\right)$ we have $(M=N) \phi_{1}$ iff $(M=N) \phi_{2}$. Two closed extended processes $A_{r}$ and $B_{r}$ are statically equivalent, written $A_{r} \approx_{s} B_{r}$, if their frames are.

Definition 45. Labeled bisimilarity $\left(\approx_{l}\right)$ is the largest symmetric relation $\mathcal{R}$ on closed extended processes such that $A_{r} \mathcal{R} B_{r}$ implies:

1. $A_{r} \approx_{s} B_{r}$
2. if $A_{r} \xrightarrow{\alpha} A_{r}^{\prime}$ and $f v(\alpha) \subseteq \operatorname{dom}\left(A_{r}\right)$ and $b n(\alpha) \cap f n\left(B_{r}\right)=\emptyset$ then $B_{r} \xrightarrow{\widehat{\alpha}} B_{r}^{\prime}$ and $A_{r}^{\prime} \mathcal{R} B_{r}^{\prime}$ for some $B_{r}^{\prime}$.

In order to avoid confusion, in the following discussions we shall use $\equiv_{o},{ }^{\tau}{ }_{o}$, ${ }^{\tau}{ }_{o}, \Downarrow_{a}^{o}, \approx_{o}$ and $\approx_{l, o}$ to refer to original structural equivalence, (strong and weak) transitions, etc defined in [3]; and use $\equiv, \xrightarrow{\tau}, \Longrightarrow, \Downarrow_{a}, \approx$ and $\approx_{l}$ for the corresponding ones generated here. To prove that $\approx_{o}\left(\right.$ resp. $\left.\approx_{l, o}\right)$ coincides with $\approx\left(\right.$ resp. $\left.\approx_{l}\right)$. We need to explore the relationship between $\xrightarrow{\alpha}$ and $\xrightarrow{\alpha}$. Their relations are mainly formalised in the following Lemma 47 and Lemma 48

We write $A_{r} \succ^{1} B_{r}$ if $A_{r}$ can be transformed to $B_{r}$ by applying to a subterm (which is not under a replication, an input, a conditional, or an output) of $A_{r}$ an axiom of structural equivalence $\equiv_{o}$, except that $!P_{r} \equiv_{o} P_{r} \mid!P_{r}$ can only be used from left to right; we write $\succ$ for the reflexive and transitive closure of $\succ^{1}$. We say a sequence $A_{r}^{1} \succ^{1} A_{r}^{2} \succ^{1} \cdots \succ^{1} A_{r}^{\ell}$ is a linear proof sequence of $A_{r}^{1} \succ A_{r}^{\ell}$.

Since the use of evaluation context before the use of structural equivalence can be swapped. Two applications of structural equivalence as well as evaluation contexts can be condensed to one, we can always obtain a derivation for any transition in which the use of structural equivalence occurs only once and at the last step. We shall call such a derivation a normalised derivation.

For $n \geq 1$, an $n$-hole evaluation context $\mathcal{C}_{r}$ is an extended process with $n$ holes which are not under a replication, an input, an output or a conditional. We write $\mathcal{C}_{r}\left[A_{r}^{1}, A_{r}^{2}, \cdots, A_{r}^{n}\right]$ for the extended process obtained by filling the holes with processes.

Lemma 46. Assume $A_{r} \succ B_{r}$ and $A_{r}=\mathcal{C}_{r}\left[!P_{r}\right]$ with $\mathcal{C}_{r}$ an evaluation context. Then there exist an evaluation context $\mathcal{C}_{r}^{\prime}$ and a plain process $Q_{r}$ such that $B_{r}=\mathcal{C}_{r}^{\prime}\left[!Q_{r}\right]$ and $\mathcal{C}_{r}\left[P_{r} \mid!P_{r}\right] \succ \mathcal{C}_{r}^{\prime}\left[Q_{r} \mid!Q_{r}\right]$.

Proof. By induction on the length of the linear proof sequence for $\succ$. If the length is 0 , the result holds immediately. Now assume $A_{r} \succ^{1} A_{r}^{1} \succ^{1} A_{r}^{2} \cdots \succ^{1} A_{r}^{\ell} \succ^{1} A_{r}^{\ell+1}=$ $B_{r}$. By the induction hypothesis there exist a plain process $R_{r}$ and an evaluation context $\mathcal{C}_{r}^{\prime \prime}$ such that

$$
\begin{equation*}
A_{r}^{\ell}=\mathcal{C}_{r}^{\prime \prime}\left[!R_{r}\right] \quad \mathcal{C}_{r}\left[P_{r} \mid!P_{r}\right] \succ \mathcal{C}_{r}^{\prime \prime}\left[R_{r} \mid!R_{r}\right] \tag{C.1}
\end{equation*}
$$

We argue by case analysis on the axiom used in deriving $A_{r}^{\ell} \succ^{1} A_{r}^{\ell+1}$. We give the details only for two cases when $\succ^{1}$ is Rewrite and SUBST. The other cases are similar.

1. $A_{o}^{\ell}=\mathcal{C}_{r}^{\prime \prime \prime}[\{M / x\}] \succ^{1} \mathcal{C}_{r}^{\prime \prime \prime}[\{N / x\}]=A_{r}^{\ell+1}$ with $M={ }_{\Sigma} N$. Since there is no way that active substitution $\{M / x\}$ can occur inside replications, it is easy to see that there exists a two-hole evaluation context $D$ such that $A_{r}^{\ell}=D\left[!R_{r},\{M / x\}\right]$, $D\left[!R_{r}, \cdot\right]=\mathcal{C}_{r}^{\prime \prime \prime}$ and $D[\cdot,\{M / x\}]=\mathcal{C}_{r}^{\prime \prime}$. Using the REWRITE axiom, we know that $D\left[R_{r} \mid!R_{r},\{M / x\}\right] \succ^{1} D\left[R_{r} \mid!R_{r},\{N / x\}\right]$. Let $\mathcal{C}_{r}^{\prime}=D[\cdot,\{N / x\}]$ and $Q_{r}=R_{r}$. Clearly $A_{r}^{\ell+1}=\mathcal{C}_{r}^{\prime}\left[!Q_{r}\right]$. Hence $\mathcal{C}_{r}\left[P_{r} \mid!P_{r}\right] \succ \mathcal{C}_{r}^{\prime \prime}\left[R_{r} \mid!R_{r}\right] \succ^{1} \mathcal{C}_{r}^{\prime}\left[Q_{r} \mid!Q_{r}\right]$ and the result holds.
2. (a) $A_{r}^{\ell}=\mathcal{C}_{r}^{\prime \prime \prime}\left[E_{r} \mid\{M / x\}\right] \succ^{1} \mathcal{C}_{r}^{\prime \prime \prime}\left[E_{r}\{M / x\} \mid\{M / x\}\right]=A_{r}^{\ell+1}$. Since the hole in any evaluation context has no chance to occur under any replication, ! $R_{r}$ in C. 1 should occur in either $E_{r}$ or $\mathcal{C}_{r}^{\prime \prime \prime}$. The analysis for the latter case is similar as the above case. Now we consider the former case. Here there exists an evaluation context $D$ such that $E_{r}=D\left[!R_{r}\right]$ and $\mathcal{C}_{r}^{\prime \prime \prime}[D[\cdot] \mid\{M / x\}]=\mathcal{C}_{r}^{\prime \prime}$. The substitution $\{M / x\}$ will apply to $D$ and $R_{r}$ while rewriting $A_{r}^{\ell}$ to $A_{r}^{\ell+1}$. Let $D^{\prime}=D\{M / x\}$ and $Q_{r}=R_{r}\{M / x\}$. We can easily see that $A_{r}^{\ell+1}=\mathcal{C}_{r}^{\prime \prime \prime}\left[D^{\prime}\left[!Q_{r}\right] \mid\{M / x\}\right]$ and $\mathcal{C}_{r}^{\prime \prime \prime}\left[D\left[R_{r} \mid!R_{r}\right] \mid\{M / x\}\right] \succ^{1} \mathcal{C}_{r}^{\prime \prime \prime}\left[D^{\prime}\left[Q_{r} \mid!Q_{r}\right] \mid\{M / x\}\right]$. Let $\mathcal{C}_{r}^{\prime}=\mathcal{C}_{r}^{\prime \prime \prime}\left[D^{\prime}[\cdot] \mid\right.$ $\{M / x\}]$. Then $A_{r}^{\ell+1}=\mathcal{C}_{r}^{\prime}\left[!Q_{r}\right]$ and $\mathcal{C}\left[P_{r} \mid!P_{r}\right] \succ \mathcal{C}_{r}^{\prime \prime}\left[R_{r} \mid!R_{r}\right] \succ \mathcal{C}_{r}^{\prime}\left[Q_{r} \mid!Q_{r}\right]$.
(b) $A_{r}^{\ell}=\mathcal{C}_{r}^{\prime \prime \prime}\left[E_{r}\{M / x\} \mid\{M / x\}\right] \succ^{1} \mathcal{C}_{r}^{\prime \prime \prime}\left[E_{r} \mid\{M / x\}\right]=A_{r}^{\ell+1}$. When $!R_{r}$ in C.1 occurs in $E_{r}\{M / x\}$, clearly there exist an evaluation context $D$ and a plain process $Q_{r}$ such that $E_{r}=D\left[!Q_{r}\right]$ and $Q_{r}\{M / x\}=R_{r}$. The rest is similar to the above case.
3. $A_{r}^{\ell}=\mathcal{C}_{r}^{\prime \prime \prime}\left[!P_{r}^{\prime}\right] \succ^{1} \mathcal{C}_{r}^{\prime \prime \prime}\left[P_{r}^{\prime} \mid!P_{r}^{\prime}\right]=A_{r}^{\ell+1}$. When $!P_{r}^{\prime}$ is $!R_{r}$ in C.1 , the result holds trivially; otherwise ! $R_{r}$ in $\mathbf{C} .1$ should occur in $\mathcal{C}_{r}^{\prime \prime \prime}$ and the remaining analysis is similar.

Lemma 47. Assume $A_{r} \xrightarrow{\alpha}{ }_{o} A_{r}^{\prime}$ where $A_{r}, A_{r}^{\prime}$ are closed and $\alpha$ is not $\bar{a}\langle x\rangle$ and $f v(\alpha) \subseteq \operatorname{dom}\left(A_{r}\right)$. Then there exist closed $B_{r}, B_{r}^{\prime}$ such that $A_{r} \succ B_{r} \xrightarrow{\alpha} B_{r}^{\prime} \equiv{ }_{o} A_{r}^{\prime}$.

Proof. Consider the normalized derivation of transition $A_{r} \xrightarrow{\alpha} A_{r}^{\prime}$.

1. $\alpha$ is $a(M)$. Then $A_{r} \equiv_{o} \mathcal{C}_{r}\left[a(x) \cdot Q_{r}\right] \xrightarrow{a(M)}{ }_{o} \mathcal{C}_{r}\left[Q_{r}\{M / x\}\right] \equiv_{o} A_{r}^{\prime}$ with $\mathcal{C}_{r}$ an evaluation context and $\mathcal{C}_{r}\left[a(x) \cdot Q_{r}\right] \xrightarrow{a(M)}{ }_{o} \mathcal{C}_{r}\left[Q_{r}\{M / x\}\right]$ derived by the rules in [3] without using $\equiv_{o}$.
We may assume $\mathcal{C}_{r}\left[a(x) \cdot Q_{r}\right]$ and $\mathcal{C}_{r}\left[Q_{r}\{M / x\}\right]$ are both closed; for otherwise we can let $\operatorname{fv}\left(\mathcal{C}_{r}\left[a(x) \cdot Q_{r}\right]\right)-\operatorname{dom}\left(\mathcal{C}_{r}\left[a(x) \cdot Q_{r}\right]\right)=\left\{x_{1}, \cdots, x_{n}\right\}$ and choose $n$ fresh names $c_{1}, \cdots, c_{n}$ and let $\sigma=\left\{c_{1} / x_{1}, \cdots, c_{n} / x_{n}\right\}$. From the hypothesis, we know that $M \sigma=M, x \notin \operatorname{var}(\sigma)$, and $\operatorname{dom}\left(A_{r}\right)=\operatorname{dom}\left(\mathcal{C}_{r}\left[a(x) \cdot P_{r}\right]\right)=\operatorname{dom}\left(A_{r}^{\prime}\right)$. It is easy to see that $A_{r}=A_{r} \sigma \equiv_{o} \mathcal{C}_{r} \sigma\left[a(x) \cdot Q_{r} \sigma\right] \xrightarrow{a(M)}{ }_{o} \mathcal{C}_{r} \sigma\left[\left(Q_{r} \sigma\right)\{M / x\}\right]=$ $\mathcal{C}_{r} \sigma\left[\left(Q_{r} \sigma\right)\{M \sigma / x\}\right] \equiv{ }_{o} A_{r}^{\prime} \sigma=A_{r}^{\prime}$.
Since $\mathcal{C}_{r}\left[a(x) \cdot Q_{r}\right] \xrightarrow{a(M)}{ }_{o} \mathcal{C}_{r}\left[Q_{r}\{M / x\}\right]$ can be derived without using $\equiv_{o}, \mathcal{C}_{r}\left[a(x) \cdot Q_{r}\right]$ $\xrightarrow{a(M)} \mathcal{C}_{r}\left[Q_{r}\{M / x\}\right]$ can also be derived by rules in Fig. C.6 without using $\equiv$. Thus $A_{r} \equiv{ }_{o} \mathcal{C}_{r}\left[a(x) \cdot Q_{r}\right] \xrightarrow{a(M)} \mathcal{C}_{r}\left[Q_{r}\{M / x\}\right] \equiv{ }_{o} A_{r}^{\prime}$. Now we proceed to construct
the required $B_{r}$ and $B_{r}^{\prime}$ as stated in the lemma. The rest of the proof goes by induction on the number of applications of $!P_{r} \equiv{ }_{o} P_{r} \mid!P_{r}$ from right to left in deriving $A_{r} \equiv{ }_{o} \mathcal{C}_{r}\left[a(x) \cdot Q_{r}\right]$. If the number is 0 , the result is immediate. So suppose the number is nonzero and consider the last application of $!P_{r} \equiv_{o} P_{r} \mid!P_{r}$ from right to left (we write $\equiv_{o}^{1}$ for the application of an axiom of structural equivalence $\equiv_{o}$ ):

$$
A_{r} \equiv_{o} \mathcal{C}_{r}^{\prime}\left[P_{r} \mid!P_{r}\right] \equiv_{o}^{1} \mathcal{C}_{r}^{\prime}\left[!P_{r}\right] \succ \mathcal{C}_{r}\left[a(x) \cdot Q_{r}\right]
$$

where $\mathcal{C}_{r}^{\prime}$ is also an evaluation context. From Lemma A.1, we know there exists $D^{\prime}$ such that $\mathcal{C}_{r}^{\prime}\left[P_{r} \mid!P_{r}\right] \succ D^{\prime}\left[R_{r} \mid!R_{r}\right]$ and $D^{\prime}\left[!R_{r}\right]=\mathcal{C}_{r}\left[a(x) . Q_{r}\right]$. Then there exists a two hole evaluation context $D$ such that $D\left[!R_{r}, \cdot\right]=\mathcal{C}_{r}$ since $a(x) \cdot Q_{r}$ cannot occur inside the replication. Moreover $D\left[R_{r} \mid!R_{r}, a(x) \cdot Q_{r}\right] \xrightarrow{a(M)} D\left[R_{r} \mid!R_{r}, Q_{r}\{M / x\}\right]$ can be derived by the rules in Fig. C.6, and

$$
\begin{aligned}
& A_{r} \equiv{ }_{o} \mathcal{C}_{r}^{\prime}\left[P_{r} \mid!P_{r}\right] \succ D\left[R_{r} \mid!R_{r}, a(x) \cdot Q_{r}\right] \xrightarrow{a(M)} \\
& D\left[R_{r} \mid!R_{r}, Q_{r}\{M / x\}\right] \equiv_{o} \mathcal{C}_{r}\left[Q_{r}\{M / x\}\right] \equiv_{o} A_{r}^{\prime}
\end{aligned}
$$

Replacing ! $R_{r}$ with $R_{r} \mid!R_{r}$ does not introduce fresh variables. In other words $D\left[R_{r} \mid\right.$ $\left.!R_{r}, a(x) \cdot Q_{r}\right]$ and $D\left[R_{r} \mid!R_{r}, Q_{r}\{M / x\}\right]$ are also closed. By induction hypothesis, there exist closed $B_{r}, B_{r}^{\prime}$ such that $A_{r} \succ B_{r} \xrightarrow{a(M)} B_{r}^{\prime} \equiv{ }_{o} A_{r}^{\prime}$.
2. $\alpha$ is $\bar{a}\langle c\rangle$. Then $A_{r} \equiv_{o} \mathcal{C}_{r}\left[\bar{a}\langle c\rangle . Q_{r}\right] \xrightarrow{\bar{a}\langle c\rangle}{ }_{o} \mathcal{C}_{r}\left[Q_{r}\right] \equiv_{o} A_{r}^{\prime}$ with $\mathcal{C}_{r}$ an evaluation context. Clearly $\mathcal{C}_{r}\left[\bar{a}\langle c\rangle . Q_{r}\right] \xrightarrow{\bar{a}\langle c\rangle} \mathcal{C}_{r}\left[Q_{r}\right]$. The rest of the proof is similar to the above case.
3. $\alpha$ is $\nu c . \bar{a}\langle c\rangle$. Then $A_{r} \equiv_{o} \nu c . \mathcal{C}_{r}\left[\bar{a}\langle c\rangle . Q_{r}\right] \xrightarrow{\nu c . \bar{a}\langle c\rangle}{ }_{o} \mathcal{C}_{r}\left[Q_{r}\right] \equiv_{o} A_{r}^{\prime}$ with $\mathcal{C}_{r}$ an evaluation context. Then we have $\nu c . \mathcal{C}_{r}\left[\bar{a}\langle c\rangle . Q_{r}\right] \xrightarrow{\nu c . \bar{a}\langle c\rangle} \mathcal{C}_{r}\left[Q_{r}\right]$. The rest of the proof is similar.
4. $\alpha$ is $\nu x \cdot \bar{a}\langle x\rangle$. Then $A_{r} \equiv_{o} \nu x \cdot \mathcal{C}_{r}\left[\bar{a}\langle x\rangle \cdot Q_{r}\right] \xrightarrow{\nu x \cdot \bar{a}\langle x\rangle}{ }_{o} \mathcal{C}_{r}\left[Q_{r}\right] \equiv_{o} A_{r}^{\prime}$ with $\mathcal{C}_{r}$ an evaluation context. By the side-condition on extended process in Section 2.1, there is exactly one $\{M / x\}$ in $\mathcal{C}_{r}$ for the restricted variable $x$. Thus there exists a two-hole evaluation context $D$ such that $\mathcal{C}_{r}=D[\{M / x\}, \cdot]$. Since the side-condition for rule Outt in Fig. C. 6 requires $x$ be fresh, we choose a fresh variable $y$ and let $\varrho=\{y / x\}$. By $\alpha$-conversion, and structural equivalence $\equiv$, we can deduce that

$$
\begin{aligned}
\nu x \cdot \mathcal{C}_{r}\left[\bar{a}\langle x\rangle \cdot Q_{r}\right]= & \nu x \cdot D\left[\{M / x\}, \bar{a}\langle x\rangle \cdot Q_{r}\right]=\nu y \cdot \varrho(D)\left[\{M / y\}, \bar{a}\langle y\rangle \cdot \varrho\left(Q_{r}\right)\right] \\
& \xrightarrow{\nu x \cdot \bar{a}\langle x\rangle} \nu y \cdot \varrho(D)\left[\{M / y\}, \varrho\left(Q_{r}\right) \mid\{y / x\}\right] \\
& \equiv \nu y \cdot D\left[\{M / y\}, Q_{r} \mid\{y / x\}\right] \equiv \nu y \cdot D\left[\{M / y\} \mid\{y / x\}, Q_{r}\right] \\
& \equiv \nu y \cdot D\left[\{M / y\} \mid\{M / x\}, Q_{r}\right] \equiv D\left[\nu y \cdot\{M / y\} \mid\{M / x\}, Q_{r}\right] \\
& \equiv D\left[\{M / x\}, Q_{r}\right]=\mathcal{C}_{r}\left[Q_{r}\right] \equiv_{o} A_{r}^{\prime}
\end{aligned}
$$

5. $\alpha$ is $\tau$. There are three cases:
(a) $A_{r} \equiv_{o} \mathcal{C}_{r}\left[\right.$ if $M=M$ then $P_{r}$ else $\left.Q_{r}\right]{ }^{\tau}{ }_{o} \mathcal{C}_{r}\left[P_{r}\right] \equiv{ }_{o} A_{r}^{\prime}$ with $\mathcal{C}_{r}$ an evaluation context.
(b) $A_{r} \equiv_{o} \mathcal{C}_{r}\left[\right.$ if $M=N$ then $P_{r}$ else $\left.Q_{r}\right] \xrightarrow{\tau}_{o} \mathcal{C}_{r}\left[Q_{r}\right] \equiv_{o} A_{r}^{\prime}$ with $M \not \mathcal{F}_{\Sigma} N$, $M, N$ are ground terms and $\mathcal{C}_{r}$ an evaluation context.
(c) $A_{r} \equiv_{o} \mathcal{C}_{r}\left[\bar{a}\langle M\rangle \cdot P_{r} \mid a(x) \cdot Q_{r}\right] \xrightarrow{\tau}_{o} \mathcal{C}_{r}\left[P_{r} \mid Q_{r}\{M / x\}\right] \equiv_{o} A_{r}^{\prime}$ with $\mathcal{C}_{r}$ an evaluation context.

The rest of the proof is similar.
Lemma 48. Assume $\alpha$ is not $\bar{a}\langle x\rangle$ and $A_{r}, A_{r}^{\prime}$ are closed.

1. If $A_{r}{ }^{\alpha}{ }_{o} A_{r}^{\prime}$ then there is a closed $A_{r}^{\prime \prime}$ such that $A_{r} \xrightarrow{\alpha} A_{r}^{\prime \prime} \equiv_{o} A_{r}^{\prime}$.
2. If $A_{r} \xrightarrow{\alpha} A_{r}^{\prime}$ then either $A_{r} \equiv_{o} A_{r}^{\prime}($ only possible when $\alpha$ is $\tau)$ or $A_{r} \xrightarrow{\alpha}{ }_{o} A_{r}^{\prime}$.

## Proof.

1. Assume $A_{r} \xrightarrow{\alpha}_{o} A_{r}^{\prime}$. By Lemma 47, there exist closed $B_{r}$ and $B_{r}^{\prime}$ such that $A_{r} \succ$ $B_{r} \xrightarrow{\alpha} B_{r}^{\prime} \equiv_{o} A_{r}^{\prime}$. Replacing every left to right application of the rule $!P_{r} \equiv_{o} P_{r} \mid!P_{r}$ in $A_{r} \succ B_{r}$ with $!P_{r} \xrightarrow{\tau} P_{r} \mid!P_{r}$, we obtain $A_{r} \Rightarrow B_{r} \xrightarrow{\alpha} B_{r}^{\prime} \equiv_{o} A_{r}^{\prime}$. Letting $A_{r}^{\prime \prime}=B_{r}^{\prime}$ gives the conclusion.
2. Assume $A_{r} \xrightarrow{\alpha} A_{r}^{\prime}$ and apply transition induction.
(a) $\alpha$ is $a(M)$. Then $A_{r} \equiv \mathcal{C}_{r}[a(x) . P] \xrightarrow{a(M)} \mathcal{C}_{r}[P\{M / x\}] \equiv A_{r}^{\prime}$ where $\mathcal{C}_{r}$ is an evaluation context. Clearly we have $A_{r} \equiv \mathcal{C}_{r}[a(x) . P] \xrightarrow{a(M)}{ }_{o} \mathcal{C}_{r}[P\{M / x\}] \equiv A_{r}^{\prime}$. Since $\equiv$ is included in $\equiv_{o}$, we have $A_{r} \xrightarrow{a(M)}{ }_{o} A_{r}^{\prime}$.
(b) The cases for $\alpha$ is $\tau$ are similar. For replications, assume $A_{r} \equiv \mathcal{C}_{r}\left[!P_{r}\right] \xrightarrow{\tau} \mathcal{C}_{r}\left[P_{r} \mid\right.$ $\left.!P_{r}\right] \equiv A_{r}^{\prime}$, then we have $A_{r} \equiv{ }_{o} A_{r}^{\prime}$.
(c) $\alpha$ is $\nu x . \bar{a}\langle x\rangle$. We have $A_{r} \equiv \mathcal{C}_{r}[\bar{a}\langle M\rangle . P] \xrightarrow{\nu x \cdot \bar{a}\langle x\rangle} \mathcal{C}_{r}[P \mid\{M / x\}] \equiv A_{r}^{\prime}$. Then we know that $A_{r} \equiv \nu x \cdot \mathcal{C}_{r}[\bar{a}\langle x\rangle . P \mid\{M / x\}] \xrightarrow{\nu x \cdot \bar{a}\langle x\rangle}{ }_{o} \mathcal{C}_{r}[P \mid\{M / x\}] \equiv A_{r}^{\prime}$.
(d) $\alpha$ is $\bar{a}\langle c\rangle$. We have $A_{r} \equiv \mathcal{C}_{r}[\bar{a}\langle c\rangle . P] \xrightarrow{\bar{a}\langle c\rangle} \mathcal{C}_{r}[P] \equiv A_{r}^{\prime}$. Then we know that $A_{r} \xrightarrow{\bar{a}\langle c\rangle} A_{r}^{\prime}$.
(e) $\alpha$ is $\nu c \cdot \bar{a}\langle c\rangle$. We have $A_{r} \equiv \nu c \cdot \mathcal{C}_{r}[\bar{a}\langle c\rangle . P] \xrightarrow{\nu c \cdot \bar{a}\langle c\rangle} \mathcal{C}_{r}[P] \equiv A_{r}^{\prime}$. Then we know that $A_{r} \xrightarrow{\nu c . \bar{a}\langle c\rangle} A_{r}^{\prime}$.

Corollary 49. Assume $\alpha$ is not $\bar{a}\langle x\rangle$ and $A_{r}, A_{r}^{\prime}$ are closed.

1. If $A_{r} \xlongequal{\alpha}{ }_{o} A_{r}^{\prime}$ then there is a closed $A_{r}^{\prime \prime}$ such that $A_{r} \xlongequal{\alpha} A_{r}^{\prime \prime} \equiv_{o} A_{r}^{\prime}$.
2. If $A_{r} \xlongequal{\alpha} A_{r}^{\prime}$ then either $A_{r} \equiv_{o} A_{r}^{\prime}$ (only possible when $\alpha$ is $\tau$ ) or $A_{r} \xlongequal{\alpha}{ }_{o} A_{r}^{\prime}$.

Proof. Using Lemma 48 several times.
Theorem 50. $\approx_{o}$ coincides with $\approx$.

## Proof.

1. $(\Longrightarrow)$ We construct a set $\mathbb{S}$ of pairs of closed extended processes such that

$$
\mathbb{S}=\left\{\left(A_{r}, B_{r}\right) \mid A_{r} \equiv_{o} \approx_{o} \equiv_{o} B_{r}\right\}
$$

and show $\mathbb{S} \subseteq \approx$. Assume $\left(A_{r}, B_{r}\right) \in \mathbb{S}$ because of $A_{r} \equiv_{o} D_{1, r} \approx_{o} D_{2, r} \equiv_{o} B_{r}$ for some closed extended processes $D_{1, r}$ and $D_{2, r}$.
(a) Assume $A_{r} \Longrightarrow A_{r}^{\prime}$. Using Corollary 49, we have $A_{r} \Longrightarrow{ }_{o} A_{r}^{\prime}$ or $A_{r} \equiv_{o} A_{r}^{\prime}$. When $A_{r} \Longrightarrow_{o} A_{r}^{\prime}$, we have $D_{1, r} \Longrightarrow_{o} A_{r}^{\prime}$. By the definition of $\approx_{o}$, there exists $D_{2, r}^{\prime}$ such that $D_{2, r} \Longrightarrow_{o} D_{2, r}^{\prime} \approx_{o} A_{r}^{\prime}$. Using Corollary 49 again gives a $B_{r}^{\prime}$ such that $B_{r} \Longrightarrow B_{r}^{\prime} \equiv_{o} D_{2, r}^{\prime}$. Hence $\left(A_{r}^{\prime}, B_{r}^{\prime}\right) \in \mathbb{S}$. When $A_{r} \equiv_{o} A_{r}^{\prime}$, let $B_{r}^{\prime}=B_{r}$. Then $B_{r} \Longrightarrow B_{r}^{\prime}$ and $A_{r}^{\prime} \equiv_{o} A_{r} \equiv_{o} \approx_{o} \equiv_{o} B_{r}=B_{r}^{\prime}$. Hence $\left(A_{r}^{\prime}, B_{r}^{\prime}\right) \in \mathbb{S}$.
(b) If $A_{r} \Downarrow_{a}$, then by Corollary 49, we have $A_{r} \Downarrow_{a}^{o}$. From $D_{1, r} \equiv_{o} A_{r}$, we have $D_{1, r} \Downarrow_{a}^{o}$. From $D_{1, r} \approx_{o} D_{2, r}$, we have $D_{2, r} \Downarrow_{a}^{o}$. From $D_{2, r} \equiv{ }_{o} B_{r}$, we have $B_{r} \Downarrow_{a}^{o}$. Using Corollary 49 again, we have $B_{r} \Downarrow_{a}$.
(c) Since $\equiv_{o}$ and $\approx_{o}$ are both closed by evaluation contexts, we have $\mathcal{C}_{r}\left[A_{r}\right] \equiv{ }_{o}$ $\mathcal{C}_{r}\left[D_{1, r}\right] \approx_{o} \mathcal{C}_{r}\left[D_{2, r}\right] \equiv_{o} \mathcal{C}_{r}\left[B_{r}\right]$, namely $\left(\mathcal{C}_{r}\left[A_{r}\right], \mathcal{C}_{r}\left[B_{r}\right]\right) \in \mathbb{S}$ for any evaluation context $\mathcal{C}_{r}$.
2. ( $\Longleftarrow)$ We construct a set $\mathbb{R}$ of pairs of closed extended processes such that

$$
\mathbb{R}=\left\{\left(A_{r}, B_{r}\right) \mid A_{r} \equiv_{o} \approx \equiv_{o} B_{r}\right\}
$$

and show that $\mathbb{R} \subseteq \approx_{o}$. Assume $\left(A_{r}, B_{r}\right) \in \mathbb{S}$ because of $A_{r} \equiv_{o} D_{1, r} \approx D_{2, r} \equiv_{o} B_{r}$ for some closed extended processes $D_{1, r}$ and $D_{2, r}$.
(a) Assume $A_{r} \xlongequal{\tau}{ }_{o} A_{r}^{\prime}$. Then we have $D_{1, r} \Longrightarrow_{o} A_{r}^{\prime}$. Using Corollary 49, there exists $D_{1, r}^{\prime}$ such that $D_{1, r} \Longrightarrow D_{1, r}^{\prime} \equiv_{o} A_{r}^{\prime}$. By the definition of $\approx$, there exists $D_{2, r}^{\prime}$ such that $D_{2, r} \Longrightarrow D_{2, r}^{\prime} \approx D_{1, r}^{\prime}$. Using Corollary 49, it gives $D_{2, r} \Longrightarrow D_{o, r}^{\prime}$ or $D_{2, r} \equiv_{o} D_{2, r}^{\prime}$. Since $B_{r} \equiv_{o} D_{2, r}$, we have $B_{r} \Longrightarrow_{o} D_{2, r}^{\prime}$ or $B_{r} \equiv_{o} D_{2, r}^{\prime}$. In the former case, let $B_{r}^{\prime}=D_{2, r}^{\prime}$ and in the latter case let $B_{r}^{\prime}=B_{r}$. We have $\left(A_{r}^{\prime}, B_{r}^{\prime}\right) \in \mathbb{R}$.
(b) If $A_{r} \Downarrow_{a}^{o}$, then $D_{1, r} \Downarrow_{a}^{o}$. Then by Corollary 49, we have $D_{1, r} \Downarrow_{a}$. From $D_{1, r} \approx$ $D_{2, r}$, we have $D_{2, r} \Downarrow_{a}$. Using Corollary 49 again, we have $D_{2, r} \Downarrow_{a}^{o}$. From $D_{2, r} \equiv \equiv_{o}$ $B_{r}$, we have $B_{r} \Downarrow_{a}^{o}$.
(c) Since $\equiv_{o}$ and $\approx$ are both closed by evaluation contexts, we have $\mathcal{C}_{r}\left[A_{r}\right] \equiv{ }_{o}$ $\mathcal{C}_{r}\left[D_{1, r}\right] \approx \mathcal{C}_{r}\left[D_{2, r}\right] \equiv{ }_{o} \mathcal{C}_{r}\left[B_{r}\right]$, namely $\left(\mathcal{C}_{r}\left[A_{r}\right], \mathcal{C}_{r}\left[B_{r}\right]\right) \in \mathbb{R}$ for any evaluation context $\mathcal{C}_{r}$.

Theorem 51. $\approx_{l, o}$ coincides with $\approx_{l}$.

## Proof.

1. $(\Longrightarrow)$ We construct the set $\mathbb{S}$ of pairs of closed extended processes such that

$$
\mathbb{S}=\left\{\left(A_{r}, B_{r}\right) \mid A_{r} \equiv_{o} \approx_{l, o} \equiv_{o} B_{r}\right\}
$$

and show $\mathbb{S} \subseteq \approx_{l}$. Assume $\left(A_{r}, B_{r}\right) \in \mathbb{S}$ because of $A_{r} \equiv_{o} C_{r} \approx_{l, o} D_{r} \equiv_{o} B_{r}$ for some closed extended processes $C_{r}$ and $D_{r}$. For the static equivalence part, although $\equiv_{o}$ has the rule REPL while $\equiv$ does not, the rewriting $\mathcal{C}\left[!P_{r}\right] \equiv{ }_{o} \mathcal{C}\left[P_{r} \mid!P_{r}\right]$ does not change the frames of processes, i.e. $\phi\left(\mathcal{C}\left[!P_{r}\right]\right)=\phi\left(\mathcal{C}\left[P_{r} \mid!P_{r}\right]\right)$. Thus $\phi\left(C_{r}\right) \equiv_{o} \nu \widetilde{n} . \sigma$ implies $\phi\left(A_{r}\right) \equiv \nu \widetilde{n} . \sigma$, and similarly $\phi\left(D_{r}\right) \equiv_{o} \nu \widetilde{m} \cdot \sigma^{\prime}$ implies $\phi\left(B_{r}\right) \equiv \nu \widetilde{m} \cdot \sigma^{\prime}$. Hence $A_{r} \sim B_{r}$ holds by the definition of $\sim$.
Now assume $A_{r} \xrightarrow{\alpha} A_{r}^{\prime}$ with $f v(\alpha) \subseteq \operatorname{dom}\left(A_{r}\right)$ and $b n(\alpha) \cap f n\left(B_{r}\right)=\emptyset$. By Lemma 48, we have $A_{r}{ }^{\alpha}{ }_{o} A_{r}^{\prime}$ or $A_{r} \equiv_{o} A_{r}^{\prime}$.
When $A_{r} \xrightarrow{\alpha}_{o} A_{r}^{\prime}$, we have $C_{r}{ }^{\alpha}{ }_{o} A_{r}^{\prime}$. By the definition of $\approx_{l, o}$, there exists $D_{r}^{\prime}$ such that $D_{r} \xrightarrow{\widehat{\alpha}} D_{r}^{\prime} \approx_{l, o} A_{r}^{\prime}$. By Corollary 49 , there exists $B_{r}^{\prime}$ such that $B_{r} \xrightarrow{\widehat{\alpha}} B_{r}^{\prime} \equiv_{o}$ $D_{r}^{\prime}$. Hence $\left(A_{r}^{\prime}, B_{r}^{\prime}\right) \in \mathbb{S}$.
When $A_{r} \equiv_{o} A_{r}^{\prime}$, from the proof of Lemma 48, we can know that this could happen only when $\alpha$ is $\tau$. In this case, let $B_{r}^{\prime}=B_{r}$. Then $B_{r} \Longrightarrow B_{r}^{\prime}$ and $A_{r}^{\prime} \equiv_{o}$ $A_{r} \equiv_{o} \approx_{l, o} \equiv_{o} B_{r}=B_{r}^{\prime}$. Hence $\left(A_{r}^{\prime}, B_{r}^{\prime}\right) \in \mathbb{S}$.
2. ( $\Longleftarrow)$ We construct the set $\mathbb{R}$ of pairs of closed extended processes such that

$$
\begin{aligned}
\mathbb{R}=\left\{\left(A_{r}, B_{r}\right)\right. & \left|\exists\{\widetilde{z}\} \subseteq \operatorname{dom}\left(A_{r}\right): A_{r}\right|\{\widetilde{z} / \widetilde{y}\} \equiv_{o} \approx_{l} \equiv_{o} B_{r} \mid\{\widetilde{z} / \widetilde{y}\} \\
& \text { for any pairwise-distinct } \left.\widetilde{y} \text { s.t. }\{\widetilde{y}\} \cap \operatorname{dom}\left(A_{r}\right)=\emptyset \text { and }|\widetilde{y}|=|\widetilde{z}|\right\}
\end{aligned}
$$

and show that $\mathbb{R} \subseteq \approx_{l, r}$. Note that when $A_{r} \approx_{l} B_{r},\{\tilde{z}\}$ is chosen to be empty. Assume $\left(A_{r}, B_{r}\right) \in \mathbb{R}$. Then there exist closed extended processes $C_{r}, D_{r}$ and variables $\widetilde{z}$ such that $A_{r}\left|\{\widetilde{z} / \widetilde{y}\} \equiv_{o} C_{r} \approx_{l} D_{r} \equiv_{o} B_{r}\right|\{\widetilde{z} / \widetilde{y}\}$ for any pairwise-distinct $\widetilde{y}$.
(a) For the static equivalence part, assume $(M=N) \phi\left(A_{r}\right)$ with $\operatorname{var}(M, N) \subseteq$ $\operatorname{dom}\left(A_{r}\right)$. As argued in $1, \phi\left(C_{r}\right) \equiv \phi\left(A_{r} \mid\{\widetilde{z} / \widetilde{y}\}\right)=\phi\left(A_{r}\right) \mid\{\widetilde{z} / \widetilde{y}\}$ and $\phi\left(D_{r}\right) \equiv$ $\phi\left(B_{r} \mid\{\widetilde{z} / \widetilde{y}\}\right)=\phi\left(B_{r}\right) \mid\{\widetilde{z} / \widetilde{y}\}$. Since $\{\widetilde{y}\} \cap \operatorname{var}(M, N)=\emptyset$, we have $(M=$ $N) \phi\left(C_{r}\right)$. From $\phi\left(C_{r}\right) \sim \phi\left(D_{r}\right)$, we obtain $(M=N) \phi\left(D_{r}\right)$. Now we show $(M=N) \phi\left(B_{r}\right)$. To this end, assume $\phi\left(D_{r}\right) \equiv \nu \widetilde{n} . \sigma$ and $M \sigma=_{\Sigma} N \sigma$. Then $\phi\left(B_{r}\right) \mid\{\widetilde{z} / \widetilde{y}\} \equiv \nu \widetilde{n} . \sigma \equiv \nu \widetilde{n} \cdot \sigma^{*}$ and $M \sigma^{*}==_{\Sigma} N \sigma^{*}\left(=_{\Sigma}\right.$ is preserved by application of $\sigma$ ). Let $\sigma^{\prime}=\left.\sigma^{*}\right|_{\operatorname{dom}\left(B_{r}\right)}$. Since $\{\widetilde{y}\} \cap f v\left(B_{r}\right)=\emptyset$ and $\{\widetilde{z}\} \subseteq \operatorname{dom}\left(B_{r}\right)$, we have $\phi\left(B_{r}\right) \equiv \nu \widetilde{y} \cdot\left(\phi\left(B_{r}\right) \mid\{\widetilde{z} / \widetilde{y}\}\right) \equiv \nu \widetilde{y} \cdot \nu \widetilde{n} . \sigma^{*} \equiv \nu \widetilde{n} \cdot \sigma^{\prime}$. Furthermore, since $M \sigma^{\prime}=M \sigma^{*}, N \sigma^{*}=N \sigma^{\prime}$ and $M \sigma^{*}=_{\Sigma} N \sigma^{*}$, we have $M \sigma^{\prime}=_{\Sigma} N \sigma^{\prime}$. Thus $(M=N) \phi\left(B_{r}\right)$ holds, hence $A_{r} \sim_{o} B_{r}$.
(b) Assume $A_{r} \xrightarrow{\alpha}{ }_{o} A_{r}^{\prime}$. We need to show that there exists $B_{r}^{\prime}$ such that $B_{r} \xrightarrow{\alpha}{ }_{o} B_{r}^{\prime}$ and $\left(A_{r}^{\prime}, B_{r}^{\prime}\right) \in \mathbb{R}$. Consider the normalized derivation of transition of $A_{r} \xrightarrow{\alpha}{ }_{o} A_{r}^{\prime}$. We distinguish two cases depending on whether $\alpha$ is $\bar{a}\langle x\rangle$ or not.
i. $\alpha$ is not $\bar{a}\langle x\rangle$. We can safely assume $\{\widetilde{y}\} \cap b v(\alpha)=\emptyset$ since $\widetilde{y}$ are arbitrary. From $A_{r} \xrightarrow{\alpha}_{o} A_{r}^{\prime}$, by PAR in [3], we know that $C_{r} \equiv_{o} A_{r}\left|\{\widetilde{z} / \widetilde{y}\} \xrightarrow{\alpha}_{o} A_{r}^{\prime}\right|$
$\{\widetilde{z} / \widetilde{y}\}=C_{r}^{\prime \prime}$. Using Corollary 49, there exists $C_{r}^{\prime}$ such that $C_{r} \xlongequal{\alpha} C_{r}^{\prime} \equiv_{o} C_{r}^{\prime \prime}$. By hypothesis $C_{r} \approx_{l} D_{r}$, there exists $D_{r}^{\prime}$ such that $D_{r} \xlongequal{\widehat{\alpha}} D_{r}^{\prime}$ and $C_{r}^{\prime} \approx_{l} D_{r}^{\prime}$. Using Corollary 49, we have $D_{r} \xrightarrow{\widehat{\alpha}}{ }_{o} D_{r}^{\prime}$ or $D_{r} \equiv_{o} D_{r}^{\prime}$.
We first check the case $D_{r} \xlongequal{\widehat{\alpha}}{ }_{o} D_{r}^{\prime}$. From $C_{r}^{\prime} \equiv_{o} C_{r}^{\prime \prime}$, we have $(\widetilde{z}=\widetilde{y}) \phi\left(C_{r}^{\prime}\right)$, hence also $(\widetilde{z}=\widetilde{y}) \phi\left(D_{r}^{\prime}\right)$. In other words, there exists $B_{r}^{\prime}$ such that $D_{r}^{\prime} \equiv_{o}$ $B_{r}^{\prime} \mid\{\widetilde{z} / \widetilde{y}\}$ with $\{\widetilde{y}\} \cap f v\left(B_{r}^{\prime}\right)=\emptyset$ (otherwise we can substitute them with the corresponding variables in $\widetilde{z}$ ). Adding restrictions $\nu \widetilde{y}$ to $B_{r} \mid\{\widetilde{z} / \widetilde{y}\} \equiv_{o} D_{r} \stackrel{\widehat{\alpha}}{\Longrightarrow}{ }_{o}$ $D_{r}^{\prime} \equiv{ }_{o} B_{r}^{\prime} \mid\{\widetilde{z} / \widetilde{y}\}$, we have $B_{r} \xrightarrow{\widehat{\alpha}}{ }_{o} B_{r}^{\prime}$. From $A_{r}^{\prime} \mid\{\widetilde{z} / \widetilde{y}\} \equiv_{o} C_{r}^{\prime} \approx_{l} D_{r}^{\prime} \equiv_{o}$ $B_{r}^{\prime} \mid\{\widetilde{z} / \widetilde{y}\}$, we know that $\left(A_{r}^{\prime}, B_{r}^{\prime}\right) \in \mathbb{R}$.
For the case when $D_{r} \equiv_{o} D_{r}^{\prime}$, from the proof of Lemma 48, we can know that $D_{r} \equiv{ }_{o} D_{r}^{\prime}$ could happen only when $\alpha$ is $\tau$. Let $B_{r}^{\prime}=B_{r}$. Then we have $B_{r} \Longrightarrow_{o} B_{r}^{\prime}$ and $A_{r}^{\prime}\left|\{\widetilde{z} / \widetilde{y}\} \equiv_{o} C_{r}^{\prime} \approx_{l} D_{r}^{\prime} \equiv_{o} D_{r} \equiv_{o} B_{r}^{\prime}\right|\{\widetilde{z} / \widetilde{y}\}$. Thus $\left(A_{r}^{\prime}, B_{r}^{\prime}\right) \in \mathbb{R}$.
ii. $\alpha$ is $\bar{a}\langle x\rangle$. In this case $A_{r} \equiv_{o} \mathcal{C}\left[\bar{a}\langle x\rangle . P_{r}\right] \xrightarrow{\bar{a}\langle x\rangle}{ }_{o} \mathcal{C}\left[P_{r}\right] \equiv_{o} A_{r}^{\prime}$ with $x \notin$ $b v(\mathcal{C})$. Choose a fresh $y^{\prime}$, then we have $C_{r} \equiv_{o} \nu y^{\prime} \cdot \mathcal{C}\left[\bar{a}\left\langle y^{\prime}\right\rangle \cdot P_{r} \mid\left\{x / y^{\prime}\right\}\right] \mid$ $\{\widetilde{z} / \widetilde{y}\} \xrightarrow{\nu y^{\prime} \cdot \bar{a}\left\langle y^{\prime}\right\rangle}{ }_{o} \mathcal{C}\left[P_{r} \mid\left\{x / y^{\prime}\right\}\right]\left|\{\widetilde{z} / \widetilde{y}\} \equiv_{o} \mathcal{C}\left[P_{r}\right]\right|\left\{\widetilde{z}, x / \widetilde{y}, y^{\prime}\right\} \equiv_{o} A_{r}^{\prime} \mid$ $\left\{\widetilde{z}, x / \widetilde{y}, y^{\prime}\right\}$ since $x$ is a free variable. From Lemma 48, there exists a closed $C_{r}^{\prime}$ such that $C_{r} \stackrel{\nu y^{\prime} . \bar{a}\left\langle y^{\prime}\right\rangle}{\Longrightarrow} C_{r}^{\prime} \equiv_{o} A_{r}^{\prime} \mid\left\{\widetilde{z}, x / \widetilde{y}, y^{\prime}\right\}$. By $C_{r} \approx_{l} D_{r}$, there exists $D_{r}^{\prime}$ such that $D_{r} \stackrel{\nu y^{\prime} \cdot \bar{a}\left\langle y^{\prime}\right\rangle}{\Longrightarrow} D_{r}^{\prime} \approx_{l} C_{r}^{\prime}$.
Assume $\phi\left(A_{r}\right) \equiv_{o} \nu \widetilde{m} . \sigma$. Then $\phi\left(C_{r}\right) \equiv_{o} \nu \widetilde{m} \cdot \sigma \mid\left\{\widetilde{z}, x / \widetilde{y}, y^{\prime}\right\} \equiv_{o} \nu \widetilde{m} .(\sigma \cup$ $\left.\left\{\widetilde{z \sigma}, x \sigma / \widetilde{y}, y^{\prime}\right\}\right)$. Hence $\left(\widetilde{z}, x=\widetilde{y}, y^{\prime}\right) \phi\left(C_{r}^{\prime}\right){ }^{5}$ Since $\phi\left(C_{r}^{\prime}\right) \sim \phi\left(D_{r}^{\prime}\right)$, we obtain $\left(\widetilde{z}, x=\widetilde{y}, y^{\prime}\right) \phi\left(D_{r}^{\prime}\right)$. Thus there exists $B_{r}^{\prime}$ such that $D_{r}^{\prime} \equiv{ }_{o} B_{r}^{\prime} \mid\left\{\widetilde{z}, x / \widetilde{y}, y^{\prime}\right\}$ with $f v\left(B_{r}^{\prime}\right) \cap\left\{\widetilde{y}, y^{\prime}\right\}=\emptyset$. Moreover $B_{r} \equiv_{o} \nu \widetilde{y} \cdot\left(B_{r} \mid\{\widetilde{z} / \widetilde{y}\}\right) \equiv \nu \widetilde{y} \cdot D_{r} \xrightarrow{\nu y^{\prime} \cdot \bar{a}\left\langle y^{\prime}\right\rangle}$ $\nu \widetilde{y} . D_{r}^{\prime} \equiv{ }_{o} B_{r}^{\prime} \mid\left\{x / y^{\prime}\right\}$. Hence $B_{r} \Rightarrow \nu y^{\prime} \cdot \mathcal{C}^{\prime}\left[\bar{a}\left\langle y^{\prime}\right\rangle \cdot Q_{r}\right] \xrightarrow{\nu y^{\prime} \cdot \bar{a}\left\langle y^{\prime}\right\rangle} \mathcal{C}^{\prime}\left[Q_{r}\right] \Rightarrow$ $B_{r}^{\prime} \mid\left\{x / y^{\prime}\right\}$ for some evaluation context $\mathcal{C}^{\prime}$. Since static equivalence is closed under reduction (Lemma 1 in [3]), $\mathcal{C}^{\prime}\left[Q_{r}\right] \sim B_{r}^{\prime} \mid\left\{x / y^{\prime}\right\}$. Moreover, since $Q_{r}$ is a plain process which does not contain any active substitution, that is to say $\mathcal{C}^{\prime}$ can rewrite $y^{\prime}$ with $x$. Hence we have $\mathcal{C}^{\prime}\left[\bar{a}\langle x\rangle \cdot Q_{r}\right] \equiv{ }_{o} \mathcal{C}^{\prime}\left[\bar{a}\left\langle y^{\prime}\right\rangle . Q_{r}\right]$ which implies $\nu y^{\prime} \cdot \mathcal{C}^{\prime}\left[\bar{a}\langle x\rangle \cdot Q_{r}\right] \equiv_{o} \nu y^{\prime} \cdot \mathcal{C}^{\prime}\left[\bar{a}\left\langle y^{\prime}\right\rangle \cdot Q_{r}\right]$. Hence $B_{r} \equiv_{o} \nu y^{\prime} \cdot \mathcal{C}^{\prime}\left[\bar{a}\langle x\rangle \cdot Q_{r}\right] \stackrel{\bar{a}\langle x\rangle}{ }{ }_{o}$ $\nu y^{\prime} \cdot \mathcal{C}^{\prime}\left[Q_{r}\right] \Rightarrow \nu y^{\prime} .\left(B_{r}^{\prime} \mid\left\{x / y^{\prime}\right\}\right) \equiv_{o} B_{r}^{\prime}$. Since $A_{r}^{\prime} \mid\left\{\widetilde{z}, x / \widetilde{y}, y^{\prime}\right\} \equiv_{o} C_{r}^{\prime} \approx_{l}$ $D_{r}^{\prime} \equiv{ }_{o} B_{r}^{\prime} \mid\left\{\widetilde{z}, x / \widetilde{y}, y^{\prime}\right\}$, and $\widetilde{y}$ and $y^{\prime}$ are arbitrary, we have that $\left(A_{r}^{\prime}, B_{r}^{\prime}\right) \in \mathbb{R}$.

## Appendix C.2. Proofs of Theorem 21 and Corollary 22

In the previous Section 5 , we define function $\mathcal{T}$ to transform an extended process in applied pi to a pure extended process, namely a extended process with no cell name, in stateful applied pi. In this section, we shall prove that this transformation function $\mathcal{T}$ keeps both observational equivalence and labelled bisimilarity, i.e. Theorem 21 in

[^4]Section 5. For the sake of readability, we recall the definition for $\mathcal{T}$ here:

$$
\begin{gathered}
\mathcal{T}(0)=(\emptyset, \emptyset) \quad \mathcal{T}\left(\nu x \cdot A_{r}\right)=\nu \widetilde{n} \cdot(\sigma, \mathcal{P}) \\
\text { if } \mathcal{T}\left(A_{r}\right)=\nu \widetilde{n} \cdot(\sigma \cup\{M / x\}, \mathcal{P}) \\
\mathcal{T}(\{M / x\})=(\{M / x\}, \emptyset) \quad \mathcal{T}\left(\nu n . A_{r}\right)=\nu n \cdot \mathcal{T}\left(A_{r}\right) \\
\mathcal{T}\left(A_{r}^{1} \mid A_{r}^{2}\right)=\nu \widetilde{n}_{1}, \widetilde{n}_{2} \cdot\left(\left(\sigma_{1} \cup \sigma_{2}\right)^{*},\left(\mathcal{P}_{1} \cup \mathcal{P}_{2}\right)\left(\sigma_{1} \cup \sigma_{2}\right)^{*}\right) \\
\text { if } \mathcal{T}\left(A_{r}^{i}\right)=\nu \widetilde{n}_{i} \cdot\left(\sigma_{i}, \mathcal{P}_{i}\right) \text { for } i=1,2 \\
\mathcal{T}\left(A_{r}\right)=\left(\emptyset,\left\{A_{r}\right\}\right) \text { in all other cases of } A_{r}
\end{gathered}
$$

Lemma 52. If $A_{r} \equiv B_{r}$ then $\mathcal{T}\left(A_{r}\right) \simeq \mathcal{T}\left(B_{r}\right)$.

Proof. Considering the normalised derivation of $A_{r} \equiv B_{r}$. The proof goes by induction on the number of derivation. Assume $A_{r} \equiv \mathcal{C}\left[D_{r}^{1}\right] \equiv{ }^{1} \mathcal{C}\left[D_{r}^{2}\right]=B_{r}$. By induction hypothesis, we have $\mathcal{T}\left(A_{r}\right) \simeq \mathcal{T}\left(\mathcal{C}\left[D_{r}^{1}\right]\right)$. We can easily check the structural equivalence $D_{r}^{1} \equiv{ }^{1} D_{r}^{2}$ defined in Figure C. 6 satisfies $\mathcal{T}\left(D_{r}^{1}\right) \simeq \mathcal{T}\left(D_{r}^{2}\right)$. Thus we have $\mathcal{T}\left(\mathcal{C}\left[D_{r}^{1}\right]\right) \simeq \mathcal{T}\left(\mathcal{C}\left[D_{r}^{2}\right]\right)$. Finally we have $\mathcal{T}\left(A_{r}\right) \simeq \mathcal{T}\left(B_{r}\right)$.

Lemma 53. Let $\mathcal{C}_{r}$ be an evaluation context in which bound names and bound variables are pairwise-distinct and different from the free ones in $\mathcal{C}_{r}$. Let $\widetilde{x}$ be a tuple of pairwise-distinct variables such that the hole is in the scope of an occurrence of $\nu x$ in $\mathcal{C}_{r}$. Then $\mathcal{T}\left(\mathcal{C}_{r}\right)=\nu \widetilde{n} .\left(\sigma_{c \backslash \widetilde{x}^{-}}, \mathcal{P}_{c^{-}}\right)$for some $\widetilde{n}, \sigma_{c}, \mathcal{P}_{c}$.

For any extended process $A_{r}$ such that $\mathcal{C}_{r}\left[A_{r}\right]$ is an extended process, if $\mathcal{T}\left(A_{r}\right)=$ $\nu \widetilde{m} .\left(\sigma_{a}, \mathcal{P}_{a}\right)$ for some of names $\widetilde{m}$ with $\{\widetilde{m}\} \cap\left(\widetilde{n} \cup f n\left(\mathcal{C}_{r}\right)\right)=\emptyset$ and some $\mathcal{P}_{a}$, then

$$
\mathcal{T}\left(\mathcal{C}_{r}\left[A_{r}\right]\right)=\nu \widetilde{n}, \widetilde{m} \cdot\left(\left(\sigma_{c} \cup \sigma_{a}\right)_{\left.{ }_{\widetilde{x}}^{*},\left(\mathcal{P}_{c} \cup \mathcal{P}_{a}\right)\left(\sigma_{c} \cup \sigma_{a}\right)^{*}\right), ~}^{\text {and }}\right.
$$

As a corollary, when $A_{r}$ is closed, we have $\mathcal{T}\left(\mathcal{C}_{r}\right)=\nu \widetilde{n} .\left(\sigma_{c^{-}}, \mathcal{P}_{c^{-}}\right)$for some $\widetilde{n}, \sigma_{c}, \mathcal{P}_{c}$ and.

$$
\mathcal{T}\left(\mathcal{C}_{r}\left[A_{r}\right]\right)=\nu \widetilde{n}, \widetilde{m} \cdot\left(\sigma_{c} \sigma_{a} \cup \sigma_{a \backslash \widetilde{x}}, \mathcal{P}_{c} \sigma_{a} \cup \mathcal{P}_{a}\right)
$$

Proof. The proof goes by induction on the structure of $\mathcal{C}_{r}$.

1. In the base case $\mathcal{C}_{r}=-$, we have $\widetilde{n}=\emptyset, \sigma_{1}=\emptyset$ and $\mathcal{P}_{1}=\emptyset$. The conclusion holds trivially.
2. Assume $\mathcal{C}_{r}=\nu l . \mathcal{C}_{r}^{\prime}$, by induction hypothesis, we have
(a) $\mathcal{T}\left(\mathcal{C}_{r}^{\prime}\right)=\nu \widetilde{n}_{1} \cdot\left(\sigma_{1 \backslash \widetilde{x}^{-}}, \mathcal{P}_{1^{-}}\right)$for some $\widetilde{n}_{1}, \sigma_{1}, \mathcal{P}_{1}$;
(b) for any $A_{r}$ with $\mathcal{T}\left(A_{r}\right)=\nu \widetilde{m} .\left(\sigma_{a}, \mathcal{P}_{a}\right)$, we have $\mathcal{T}\left(\mathcal{C}_{r}^{\prime}\left[A_{r}\right]\right)=\nu \widetilde{n}_{1}, \widetilde{m} \cdot\left(\left(\sigma_{1} \cup\right.\right.$ $\left.\left.\sigma_{a}\right)_{\widetilde{x}}^{*},\left(\mathcal{P}_{1} \cup \mathcal{P}_{a}\right)\left(\sigma_{1} \cup \sigma_{a}\right)^{*}\right)$ where $\widetilde{x}$ is the variables such that the hole in $\mathcal{C}_{r}^{\prime}$ is in the scope of $\nu x$.

Then we have $\mathcal{T}\left(\nu l . \mathcal{C}_{r}^{\prime}\right)=\nu l, \widetilde{n}_{1} \cdot\left(\sigma_{1 \backslash \widetilde{x}^{-}}, \mathcal{P}_{1^{-}}\right)$and $\mathcal{T}\left(\nu l . \mathcal{C}_{r}^{\prime}\left[A_{r}\right]\right)=\nu l, \widetilde{n}_{1}, \widetilde{m} .\left(\left(\sigma_{1} \cup\right.\right.$ $\left.\left.\sigma_{a}\right)_{(\widetilde{x}}^{*},\left(\mathcal{P}_{1} \cup \mathcal{P}_{a}\right)\left(\sigma_{1} \cup \sigma_{a}\right)^{*}\right)$.
3. Assume $\mathcal{C}_{r}=\nu z \cdot \mathcal{C}_{r}^{\prime}$, By induction hypothesis, we have
(a) $\mathcal{T}\left(\mathcal{C}_{r}^{\prime}\right)=\nu \widetilde{n} .\left(\sigma_{1 \backslash \widetilde{x}^{-}}, \mathcal{P}_{1^{-}}\right)$for some $\widetilde{n}, \sigma_{1}, \mathcal{P}_{1}$;
(b) for any $A_{r}$ with $\mathcal{T}\left(A_{r}\right)=\nu \widetilde{m} .\left(\sigma_{a}, \mathcal{P}_{a}\right)$, we have $\mathcal{T}\left(\mathcal{C}_{r}^{\prime}\left[A_{r}\right]\right)=\nu \widetilde{n}, \widetilde{m} \cdot\left(\left(\sigma_{1} \cup\right.\right.$ $\left.\sigma_{a}\right)_{\backslash \tilde{x}}^{*}$,
$\left.\left(\mathcal{P}_{1} \cup \mathcal{P}_{a}\right)\left(\sigma_{1} \cup \sigma_{a}\right)^{*}\right)$ and $\widetilde{x}$ is the variables such that the hole in $\mathcal{C}_{r}^{\prime}$ is in the scope of $\nu x$.

Then we have $\mathcal{T}\left(\nu z . \mathcal{C}_{r}^{\prime}\right)=\nu \widetilde{n} \cdot\left(\sigma_{1 \backslash \widetilde{x}, z^{-}}, \mathcal{P}_{1^{-}}\right)$and $\mathcal{T}\left(\nu z . \mathcal{C}_{r}^{\prime}\left[A_{r}\right]\right)=\nu \widetilde{n}, \widetilde{m} .\left(\left(\sigma_{1} \cup\right.\right.$ $\left.\left.\sigma_{a}\right)_{\widehat{x}, z}^{*},\left(\mathcal{P}_{1} \cup \mathcal{P}_{a}\right)\left(\sigma_{1} \cup \sigma_{a}\right)^{*}\right)$.
4. Assume $\mathcal{C}_{r}=\mathcal{C}_{r}^{\prime} \mid B_{r}$, then $\mathcal{T}\left(\mathcal{C}_{r}\right)=\mathcal{T}\left(\mathcal{C}_{r}^{\prime} \mid B_{r}\right)$. By induction hypothesis, we have
(a) $\mathcal{T}\left(\mathcal{C}_{r}^{\prime}\right)=\nu \widetilde{n}_{1} \cdot\left(\sigma_{1 \backslash \widetilde{x}^{-}}, \mathcal{P}_{1^{-}}\right)$for some $\widetilde{n}_{1}, \sigma_{1}, \mathcal{P}_{1}$;
(b) for any $A_{r}$ with $\mathcal{T}\left(A_{r}\right)=\nu \widetilde{m} \cdot\left(\sigma_{a}, \mathcal{P}_{a}\right)$, we have $\mathcal{T}\left(\mathcal{C}_{r}^{\prime}\left[A_{r}\right]\right)=\nu \widetilde{n}_{1}, \widetilde{m} \cdot\left(\left(\sigma_{1} \cup\right.\right.$ $\left.\sigma_{a}\right)_{\backslash \widetilde{x}}^{*}$,
$\left.\left(\mathcal{P}_{1} \cup \mathcal{P}_{a}\right)\left(\sigma_{1} \cup \sigma_{a}\right)^{*}\right)$ where $\widetilde{x}$ is the variables such that the hole in $\mathcal{C}_{r}^{\prime}$ is in the scope of $\nu x$.

Let $\mathcal{T}\left(B_{r}\right)=\nu \widetilde{n}_{2} \cdot\left(\sigma_{2}, \mathcal{P}_{2}\right)$. Then $\mathcal{T}\left(\mathcal{C}_{r} \mid B_{r}\right)=\nu \widetilde{n}_{1}, \widetilde{n}_{2} \cdot\left(\left(\sigma_{1 \backslash \widetilde{x}} \cup \sigma_{2}\right)^{*}-,\left(\mathcal{P}_{1} \cup\right.\right.$ $\left.\left.\mathcal{P}_{2}\right)\left(\sigma_{1 \backslash \tilde{x}} \cup \sigma_{2}\right)^{*}-\right)$. And $\mathcal{T}\left(\mathcal{C}_{r}^{\prime}\left[A_{r}\right] \mid B_{r}\right)=\nu \widetilde{n}_{1}, \widetilde{n}_{2}, \widetilde{m} .\left(\left(\left(\sigma_{1} \cup \sigma_{a}\right)_{{ }_{\mid x}^{*}}^{*} \cup \sigma_{2}\right)^{*},\left(\left(\mathcal{P}_{1} \cup\right.\right.\right.$ $\left.\left.\left.\mathcal{P}_{a}\right)\left(\sigma_{1} \cup \sigma_{a}\right)^{*} \cup \mathcal{P}_{2}\right)\left(\left(\sigma_{1} \cup \sigma_{a}\right)_{\stackrel{x}{x}}^{*} \cup \sigma_{2}\right)^{*}\right)$. Since the variable restricted by $\nu \widetilde{x}$ cannot occur in $B_{r}$ and the domains of $\sigma_{1}, \sigma_{2}, \sigma_{a}$ are pairwise disjoint and these substitutions are all cycle-free, we can see that the order of iterating the substitutions $\sigma_{1}, \sigma_{2}, \sigma_{a}$ does not matter and we can derive that $\left(\sigma_{1 \backslash \widetilde{x}} \cup \sigma_{2}\right)^{*}=\left(\sigma_{1} \cup \sigma_{2}\right)_{\backslash \widetilde{x}}^{*},\left(\left(\sigma_{1} \cup \sigma_{a}\right)_{\backslash \widetilde{x}}^{*} \cup \sigma_{2}\right)^{*}=$ $\left(\left(\sigma_{1} \cup \sigma_{a}\right)^{*} \cup \sigma_{2}\right)_{\widehat{x}}^{*}$, and $\left(\left(\sigma_{1} \cup \sigma_{a}\right)^{*} \cup \sigma_{2}\right)^{*}=\left(\left(\sigma_{1} \cup \sigma_{2}\right)^{*} \cup \sigma_{a}\right)^{*}=\left(\sigma_{1} \cup \sigma_{2} \cup \sigma_{a}\right)^{*}$. Since $\widetilde{x}$ do not occur in $\mathcal{P}_{1}, \mathcal{P}_{2}$, we have $\mathcal{T}\left(\mathcal{C}_{r} \mid B_{r}\right)=\nu \widetilde{n}_{1}, \widetilde{n}_{2} \cdot\left(\left(\sigma_{1} \cup \sigma_{2}\right)_{\widehat{x}^{-}}^{*},\left(\mathcal{P}_{1} \cup\right.\right.$ $\left.\left.\mathcal{P}_{2}\right)\left(\sigma_{1} \cup \sigma_{2}\right)^{*}-\right)$. And $\mathcal{T}\left(\mathcal{C}_{r}^{\prime}\left[A_{r}\right] \mid B_{r}\right)=\nu \widetilde{n}_{1}, \widetilde{n}_{2}, \widetilde{m} .\left(\left(\left(\sigma_{1} \cup \sigma_{a}\right)^{*} \cup \sigma_{2}\right)_{\widehat{x}_{\tilde{x}}^{*}}^{*},\left(\left(\mathcal{P}_{1} \cup\right.\right.\right.$ $\left.\left.\left.\mathcal{P}_{a}\right)\left(\sigma_{1} \cup \sigma_{a}\right)^{*} \cup \mathcal{P}_{2}\right)\left(\left(\sigma_{1} \cup \sigma_{a}\right)_{\backslash \tilde{x}}^{*} \cup \sigma_{2}\right)^{*}\right)=\nu \widetilde{n}_{1}, \widetilde{n}_{2}, \widetilde{m} .\left(\left(\left(\sigma_{1} \cup \sigma_{2}\right)^{*} \cup \sigma_{a}\right)_{\backslash \widetilde{x}}^{*},\left(\left(\mathcal{P}_{1} \cup\right.\right.\right.$ $\left.\left.\mathcal{P}_{a}\right)\left(\sigma_{1} \cup \sigma_{2} \cup \sigma_{a}\right)^{*} \cup \mathcal{P}_{2}\left(\sigma_{1} \cup \sigma_{2} \cup \sigma_{a}\right)^{*}\right)=\nu \widetilde{n}_{1}, \widetilde{n}_{2}, \widetilde{m} \cdot\left(\left(\left(\sigma_{1} \cup \sigma_{2}\right)^{*} \cup \sigma_{a}\right)_{\langle\widetilde{x}}^{*},\left(\left(\mathcal{P}_{1} \cup\right.\right.\right.$ $\left.\left.\left.\mathcal{P}_{2}\right)\left(\sigma_{1} \cup \sigma_{2}\right)^{*} \cup \mathcal{P}_{a}\right)\left(\left(\sigma_{1} \cup \sigma_{2}\right)^{*} \cup \sigma_{a}\right)^{*}\right)$.

When $A_{r}$ is closed, the active substititons in $\mathcal{C}_{r}$ will not be applied to $A_{r}$, the proof is similar to the above general case.

Lemma 54. If $A_{r} \xrightarrow{\alpha} A_{r}^{\prime}$ with $f v\left(A_{r}\right) \cap b v(\alpha)=\emptyset$, then $\mathcal{T}\left(A_{r}\right) \xrightarrow{\alpha} B \simeq \mathcal{T}\left(A_{r}^{\prime}\right)$ for some $B$.

Proof. Consider the normalized derivation of transition of $A_{r} \xrightarrow{\alpha} A_{r}^{\prime}$. We only take the case when $\alpha=\bar{a}\langle c\rangle$ as an example here and the other cases are similar. Assume $A_{r} \equiv \mathcal{C}\left[\bar{a}\langle c\rangle . P_{r}\right] \xrightarrow{\bar{a}\langle c\rangle} \mathcal{C}\left[P_{r}\right] \equiv A_{r}^{\prime}$ and $\mathcal{T}(\mathcal{C})=\nu \widetilde{n} .\left(\sigma_{\backslash \widetilde{x}^{-}}, \mathcal{P}-\right)$. By Lemma 52 and Lemma53, we have that

$$
\mathcal{T}\left(A_{r}\right) \simeq \nu \widetilde{n} .\left(\sigma_{\backslash \widetilde{x}},\left\{\bar{a}\langle c\rangle . P_{r} \sigma\right\} \cup \mathcal{P}\right) \xrightarrow{\bar{a}\langle c\rangle} \nu \widetilde{n} .\left(\sigma_{\backslash \widetilde{x}},\left\{P_{r} \sigma\right\} \cup \mathcal{P}\right)
$$

Let $\mathcal{T}\left(P_{r}\right)=\nu \widetilde{m} .(\emptyset, \mathcal{Q})$ for some $\widetilde{m}, \mathcal{Q}$. From $\mathcal{C}\left[P_{r}\right] \equiv A_{r}^{\prime}$, using Lemma 52 and Lemma 53, we have $\mathcal{T}\left(A_{r}^{\prime}\right) \simeq \mathcal{T}\left(\mathcal{C}\left[P_{r}\right]\right)=\nu \widetilde{n}, \widetilde{m} .(\sigma, \mathcal{Q} \sigma \cup \mathcal{P})$. For a plain process $P_{r}$, the function $\mathcal{T}$ only pulls the name binders to the top level and split the parallel composition, thus we can see that $\mathcal{T}\left(A_{r}\right) \simeq \nu \widetilde{n} .\left(\sigma_{\backslash \tilde{x}},\left\{\bar{a}\langle c\rangle . P_{r} \sigma\right\} \cup \mathcal{P}\right) \xrightarrow{\bar{a}\langle c\rangle}$ $\nu \widetilde{n} .\left(\sigma_{\backslash \widetilde{x}},\left\{P_{r} \sigma\right\} \cup \mathcal{P}\right) \Longrightarrow \nu \widetilde{n}, \widetilde{m} \cdot\left(\sigma_{\backslash \widetilde{x}}, \mathcal{Q} \sigma \cup \mathcal{P}\right)=\mathcal{T}\left(\mathcal{C}\left[P_{r}\right]\right) \simeq \mathcal{T}\left(A_{r}^{\prime}\right)$. That is to say there exist $A$ and $A^{\prime}$ such that $\mathcal{T}\left(A_{r}\right) \simeq A \xlongequal{\bar{a}\langle c\rangle} A^{\prime} \simeq \mathcal{T}\left(A_{r}^{\prime}\right)$. By Corollary 15, there exists $B$ such that $\mathcal{T}\left(A_{r}\right) \stackrel{\bar{a}\langle c\rangle}{\Longrightarrow} B \simeq A^{\prime} \simeq \mathcal{T}\left(A_{r}^{\prime}\right)$. This concludes the proof.

Corollary 55. If $A_{r} \xlongequal{\alpha} A_{r}^{\prime}$ with $f v(A) \cap b v(\alpha)=\emptyset$, then $\mathcal{T}\left(A_{r}\right) \stackrel{\alpha}{\Longrightarrow} B \simeq \mathcal{T}\left(A_{r}^{\prime}\right)$ for some $B$.

Proof. Using Corollary 15 and Lemma 54 several times.
Lemma 56. If $\mathcal{T}\left(A_{r}\right)=\nu \widetilde{n}\left(\sigma,\left\{P_{i}\right\}_{i}\right)$ then $A_{r} \equiv \nu \widetilde{n} \cdot\left(\sigma \mid \prod_{i} P_{i}\right)$.

Proof. We proceed induction on the definition of $\mathcal{T}$. The interesting cases are $A_{r} \mid B_{r}$ and $\nu x . A_{r}$ while the other cases are trivial. For parallel composition $A_{r} \mid B_{r}$, by induction hypothesis, we know $A_{r} \equiv \nu \widetilde{n} .\left(\sigma_{1} \mid \prod_{i} P_{i}\right)$ and $B_{r} \equiv \nu \widetilde{m} .\left(\sigma_{2} \mid \prod_{j} Q_{j}\right)$ where $\mathcal{T}\left(A_{r}\right)=\nu \widetilde{n} .\left(\sigma_{1},\left\{P_{i}\right\}_{i}\right)$ and $\mathcal{T}\left(B_{r}\right)=\nu \widetilde{m} .\left(\sigma_{2},\left\{Q_{j}\right\}_{j}\right)$. Let $\sigma=\left(\sigma_{1} \cup \sigma_{2}\right)^{*}$. From the definition of $\mathcal{T}$, we have $\mathcal{T}\left(A_{r} \mid B_{r}\right)=\nu \widetilde{n}, \widetilde{m} .\left(\sigma, \mathcal{P}_{1} \sigma \cup \mathcal{P}_{2} \sigma\right)$. Note that applying active substitutions until reaching idempotemce keeps structural equivalence. From structural equivalence, we can deduce that $A_{r}\left|B_{r} \equiv \nu \widetilde{n} .\left(\sigma_{1} \mid \prod_{i} P_{i}\right)\right| \nu \widetilde{m} .\left(\sigma_{2} \mid\right.$ $\left.\prod_{j} Q_{j}\right) \equiv \nu \widetilde{n} . \nu \widetilde{m} .\left(\sigma_{1}\left|\prod_{i} P_{i}\right| \sigma_{2} \mid \prod_{j} Q_{j}\right) \equiv \nu \widetilde{n} . \nu \widetilde{m} \cdot\left(\sigma\left|\prod_{i} P_{i} \sigma\right| \prod_{j} Q_{j} \sigma\right)$. The result holds for parallel composition. For the case $\mathcal{T}\left(\nu x . A_{r}\right)=\nu \widetilde{n} .\left(\sigma,\left\{P_{i}\right\}_{i}\right)$ where $\mathcal{T}\left(A_{r}\right)=\nu \widetilde{n} \cdot\left(\sigma \cup\{M / x\},\left\{P_{i}\right\}_{i}\right)$, by induction hypothesis we have $A_{r} \equiv$ $\nu \widetilde{n} .\left(\sigma|\{M / x\}| \prod_{i} P_{i}\right)$. Since $P_{i}$ are applied, $x$ will not occur in $\sigma$ or $P_{i}$. Hence we have $\nu x . A_{r} \equiv \nu x . \nu \widetilde{n} .\left(\sigma|\{M / x\}| \prod_{i} P_{i}\right) \equiv \nu \widetilde{n} .\left(\sigma \mid \prod_{i} P_{i}\right)$ and $\mathcal{T}\left(\nu x . A_{r}\right)=$ $\nu \widetilde{n} .\left(\sigma,\left\{P_{i}\right\}_{i}\right)$.

Lemma 57. If $\mathcal{T}\left(A_{r}\right) \simeq \nu \widetilde{n}\left(\sigma,\left\{P_{i}\right\}_{i}\right)$ then $A_{r} \equiv \nu \widetilde{n} \cdot\left(\sigma \mid \prod_{i} P_{i}\right)$.

Proof. The proof goes by induction on the number of rewriting steps of $\simeq$. When the number is zero, it is Lemma 56. Assume $\mathcal{T}\left(A_{r}\right) \simeq \nu \widetilde{m}\left(\sigma^{\prime},\left\{P_{i}^{\prime}\right\}_{i}\right) \simeq^{1} \nu \widetilde{n}\left(\sigma,\left\{P_{i}\right\}_{i}\right)$. By induction hypothesis $A_{r} \equiv \nu \widetilde{m} .\left(\sigma^{\prime} \mid \prod_{i} P_{i}^{\prime}\right)$. According to Definition 12, we can easily see that $\nu \widetilde{m} .\left(\sigma^{\prime} \mid \prod_{i} P_{i}^{\prime}\right) \equiv \nu \widetilde{n} .\left(\sigma \mid \prod_{i} P_{i}\right)$. Hence $A_{r} \equiv \nu \widetilde{n} .\left(\sigma \mid \prod_{i} P_{i}\right)$.

Lemma 58. If $A_{r}$ is closed and $\mathcal{T}\left(A_{r}\right) \xrightarrow{\alpha} A$ with $f v(\alpha) \subseteq \operatorname{dom}\left(\mathcal{T}\left(A_{r}\right)\right)$. Then there exists a closed $A_{r}^{\prime}$ such that $A_{r} \stackrel{\alpha}{\Longrightarrow} A_{r}^{\prime}$ and $\mathcal{T}\left(A_{r}^{\prime}\right) \simeq A$.

Proof. We take the case for the expansion of replication as the example here. The other cases are similar.

Assume $\mathcal{T}\left(A_{r}\right)=\nu \widetilde{n} .\left(\sigma,\left\{Q_{i}\right\}_{i} \cup\left\{!P_{r}\right\}\right) \xrightarrow{\tau} \nu \widetilde{n} .\left(\sigma,\left\{Q_{i}\right\}_{i} \cup\left\{!P_{r}, P_{r}\right\}\right)=A$. By Lemma57, we have $A_{r} \equiv \nu \widetilde{n} .\left(\sigma\left|!P_{r}\right| \prod_{i} Q_{i}\right)$. Hence $A_{r} \equiv \nu \widetilde{n} .\left(\sigma\left|!P_{r}\right| \prod_{i} Q_{i}\right) \xrightarrow{\tau}$ $\nu \widetilde{n} .\left(\sigma\left|P_{r}\right|!P_{r} \mid \prod_{i} Q_{i}\right)=A_{r}^{\prime}$. Assume $\mathcal{T}\left(P_{r}\right)=\nu \widetilde{m} .(\emptyset, \mathcal{Q})$ for some $\widetilde{m}, \mathcal{Q}$. Since $\mathcal{T}$ only pulls out name binders and split parallel compositions for $P_{r}$, we can see that $\mathcal{T}\left(A_{r}^{\prime}\right)=\nu \widetilde{n}, \widetilde{m} .\left(\sigma,\left\{Q_{i}\right\}_{i} \cup\left\{!P_{r}\right\} \cup \mathcal{Q}\right) \simeq A$. Since $A_{r}$ is closed, we know that $\mathcal{T}\left(A_{r}\right), A$ and $A_{r}^{\prime}$ are also closed.

Corollary 59. If $A_{r}$ is closed and $\mathcal{T}\left(A_{r}\right) \xlongequal{\alpha} A$ with $f v(\alpha) \subseteq \operatorname{dom}\left(\mathcal{T}\left(A_{r}\right)\right)$. Then there exists a closed $A_{r}^{\prime}$ such that $A_{r} \stackrel{\alpha}{\Longrightarrow} A_{r}^{\prime}$ and $\mathcal{T}\left(A_{r}^{\prime}\right) \simeq A$.

Proof. By repeated applications of Lemma 58 and Corollary 15
Lemma 60. Static equivalence $\approx_{s}$ on pure extended processes is closed under $\simeq$.

Proof. Since $\approx_{s}$ is symmetric, it is sufficient to prove $\approx_{s} \simeq \subseteq \approx_{s}$. The proof goes by induction on the length of derivation sequence for $\simeq$. When the length is 0 , the result holds trivially. For the inductive step, w.l.o.g., we may assume $A \approx_{s} A^{\prime} \simeq$ $B \simeq^{1} C$. By the induction hypothesis, we have $A \approx_{s} B$. Now we show $A \approx_{s} C$. We can easily check $A \approx_{s} C$ holds for the cases when the rewriting $B \simeq^{1} C$ is on restricted names or parallel composition. For the term rewriting case, assume $B=$ $\nu \widetilde{n} .(\sigma\{M / z\}, \mathcal{P}\{M / z\}) \simeq^{1} \nu \widetilde{n} .(\sigma\{N / z\}, \mathcal{P}\{N / z\})=C$ and $M=_{\Sigma} N$. Then for each $x \in \operatorname{dom}(A)$ we have $\sigma\{M / z\}(x)=_{\Sigma} \sigma\{N / z\}(x)$. Let $A=\nu \widetilde{m} .\left(\sigma^{\prime}, \mathcal{P}^{\prime}\right)$. Since $A \approx_{s} B$, for any $N_{1}, N_{2}$ with name $\left(N_{1}, N_{2}\right) \cap\{\widetilde{n}, \widetilde{m}\}=\emptyset, N_{1} \sigma^{\prime}={ }_{\Sigma} N_{2} \sigma^{\prime}$ iff $N_{1} \sigma\{M / z\}=_{\Sigma} N_{2} \sigma\{M / z\}$. Since $M=_{\Sigma} N, N_{1} \sigma\{M / z\}={ }_{\Sigma} N_{1} \sigma\{N / z\}$ and $N_{2} \sigma\{M / z\}={ }_{\Sigma} N_{2} \sigma\{N / z\}$. Thus $N_{1} \sigma^{\prime}={ }_{\Sigma} N_{2} \sigma^{\prime}$ iff $N_{1} \sigma\{N / z\}={ }_{\Sigma} N_{2} \sigma\{N / z\}$. Therefore $A \approx_{s} C$.

The transformation function $\approx_{s}$ preserves static equivalence.
Lemma 61. Let $A_{r}$ and $B_{r}$ be two closed extended processes. Then $A_{r} \approx_{s} B_{r}$ iff $\mathcal{T}\left(A_{r}\right) \approx_{s} \mathcal{T}\left(B_{r}\right)$.

Proof. Let $\mathcal{T}\left(A_{r}\right)=\nu \widetilde{n}_{1} \cdot\left(\sigma_{1}, \mathcal{P}_{1}\right)$ and $\mathcal{T}\left(B_{r}\right)=\nu \widetilde{n}_{2} \cdot\left(\sigma_{2}, \mathcal{P}_{2}\right)$. According to the definition of $\mathcal{T}$, we can see that $\phi\left(A_{r}\right) \equiv \nu \widetilde{n}_{1} . \sigma_{1}$. Whenever $\phi\left(A_{r}\right) \equiv \nu \widetilde{m} . \sigma$, we have that $\nu \widetilde{n}_{1} \cdot \sigma_{1} \equiv \nu \widetilde{m} \cdot \sigma$. Using Lemma 52, we have $\nu \widetilde{n}_{1} \cdot \sigma_{1} \simeq \nu \widetilde{m} \cdot \sigma^{*}$.

1. $(\Longleftarrow)$ Let $M, N$ be two arbitrary terms with $\operatorname{var}(M, N) \subseteq \operatorname{dom}\left(A_{r}\right)$ and $M \sigma={ }_{\Sigma}$ $N \sigma$ for some $\phi\left(A_{r}\right) \equiv \nu \widetilde{m} . \sigma$. Since $={ }_{\Sigma}$ is closed under the application of substitutions, we have $M \sigma^{*}=_{\Sigma} N \sigma^{*}$. From $\nu \widetilde{n}_{2} \cdot \sigma_{2} \approx_{s} \nu \widetilde{n}_{1} \cdot \sigma_{1} \simeq \nu \widetilde{m} . \sigma^{*}$. By Lemma 60 , we have $\nu \widetilde{n}_{2} \cdot \sigma_{2} \approx_{s} \nu \widetilde{m} \cdot \sigma^{*}$. That is to say $M \sigma_{2}=_{\Sigma} N \sigma_{2}$. From $\phi\left(B_{r}\right) \equiv \nu \widetilde{n}_{2} \cdot \sigma_{2}$, we know $A_{r} \sim B_{r}$.
2. $(\Longrightarrow)$ Let $M, N$ be two arbitrary terms. Assume $M \sigma_{1}=_{\Sigma} N \sigma_{1}$. We need to show $M \sigma_{2}=_{\Sigma} N \sigma_{2}$. Since $\nu \widetilde{n}_{1} . \sigma_{1} \equiv \phi\left(A_{r}\right)$. By the hypothesis $A_{r} \sim B_{r}$, there exist $\widetilde{m}, \sigma$ such that $\phi\left(B_{r}\right) \equiv \nu \widetilde{m} . \sigma$ and $M \sigma=_{\Sigma} N \sigma$. Since $=_{\Sigma}$ is closed under substitution, it holds that $M \sigma^{*}=_{\Sigma} N \sigma^{*}$. From $\nu \widetilde{m} \cdot \sigma^{*} \simeq \nu \widetilde{n}_{2} \cdot \sigma_{2}$. By Lemma 60 we obtain $\nu \widetilde{m} \cdot \sigma^{*} \approx_{s} \nu \widetilde{n}_{2} . \sigma_{2}$. Hence $M \sigma_{2}=_{\Sigma} N \sigma_{2}$. Thus $\mathcal{T}\left(A_{r}\right) \approx_{s} \mathcal{T}\left(B_{r}\right)$.

The following proposition states that transformation $\mathcal{T}$ keeps labelled bisimilarity.
Proposition 62. $A_{r} \approx_{l} B_{r}$ if and only if $\mathcal{T}\left(A_{r}\right) \approx_{l} \mathcal{T}\left(B_{r}\right)$.

## Proof.

1. $(\Longleftarrow)$ We construct a set $\mathbb{R}$ on closed extended processes thus

$$
\mathbb{R}=\left\{\left(A_{r}, B_{r}\right) \mid \mathcal{T}\left(A_{r}\right) \simeq \approx_{l} \simeq \mathcal{T}\left(B_{r}\right)\right\} .
$$

We show $\mathbb{R} \subseteq \approx_{l}$. Suppose $\mathcal{T}\left(A_{r}\right) \simeq C \approx_{l} D \simeq \mathcal{T}\left(B_{r}\right)$. In combination with Lemma 61 and Lemma 60 we obtain the static equivalence part $A_{r} \approx_{s} B_{r}$ immediately. We are left to show the agreement between transitions. Suppose $A_{r} \xrightarrow{\alpha} A_{r}^{\prime}$ with $f v(\alpha) \subseteq$ $\operatorname{dom}\left(A_{r}\right)$. Clearly $A_{r}, A_{r}^{\prime}, C, D$ are all closed. From Lemma 54 and Corollary 14 . there exists $C^{\prime}$ such that $C \xlongequal{\alpha} C^{\prime} \simeq \mathcal{T}\left(A_{r}^{\prime}\right)$, where $C^{\prime}$ is closed because $C$ is closed and $f v(\alpha) \subseteq \operatorname{dom}(C)=\operatorname{dom}\left(A_{r}\right)$. From $D \approx_{l} C$, there exists $D^{\prime}$ such that $D \xlongequal{\widehat{\alpha}}$ $D^{\prime} \approx_{l} C^{\prime}$. By Corollary 15 and Corollary 59 we can deduce that there exists a closed $B_{r}^{\prime}$ such that $B_{r} \xrightarrow{\widehat{\alpha}} B_{r}^{\prime}$ and $\mathcal{T}\left(B_{r}^{\prime}\right) \simeq D^{\prime}$. Hence $\left(A_{r}^{\prime}, B_{r}^{\prime}\right) \in \mathbb{R}$.
2. $(\Longrightarrow)$ This direction is proved by constructing a set $\mathbb{S}$ on closed processes thus

$$
\mathbb{S}=\left\{(A, B) \mid A \simeq \mathcal{T}\left(A_{r}\right), A_{r} \approx_{l} B_{r}, \mathcal{T}\left(B_{r}\right) \simeq B\right\}
$$

We show $\mathbb{S} \subseteq \approx_{l}$. First, $A \approx_{s} B$ follows from Lemma 61 and Lemma 60 Suppose $A \xrightarrow{\alpha} A^{\prime}$. By Corollary 14 we have $\mathcal{T}\left(A_{r}\right) \xlongequal{\alpha} A_{1} \simeq A^{\prime}$. By Lemma 58 we have $A_{r} \xrightarrow{\alpha} A_{r}^{\prime}$ and $\mathcal{T}\left(A_{r}^{\prime}\right) \simeq A_{1} \simeq A^{\prime}$. Since $A_{r} \approx_{l} B_{r}$, there is some $B_{r}^{\prime}$ such that $B_{r} \xlongequal{\alpha} B_{r}^{\prime} \approx_{l} A_{r}^{\prime}$. By Corollary 55 and Corollary 15 we have $B \xlongequal{\alpha} B^{\prime} \simeq \mathcal{T}\left(B_{r}^{\prime}\right)$. Hence $\left(A^{\prime}, B^{\prime}\right) \in \mathbb{S}$.

Now we start to prove that transformation $\mathcal{T}$ keeps observational equivalence. Recall that on closed pure extended processes, the observational equivalence $\approx^{e}$ is defined exactly the same as in Definition 1 except that the evaluation context is pure, that is, the context does not contain any cell name.

Lemma 63. Assume two closed pure extended processes $A, B$. If $A \approx^{e} B$ then $A_{\backslash \tilde{z}} \approx^{e} B_{\backslash \tilde{z}}$ for any variables $\widetilde{z} \subseteq \operatorname{dom}(A)$.

Proof. We construct a set $\mathcal{R}$ as follows

$$
\mathcal{R}=\left\{\left(A_{\backslash \widetilde{z}}, B \backslash \widetilde{z}\right) \mid A \approx^{e} B, \widetilde{z} \subseteq \operatorname{dom}(A)\right\}
$$

and we will prove that $\mathcal{R} \subseteq \approx$. For the part related to $\Downarrow_{a}$ and $\Longrightarrow$, we can easily see that removing or adding any active substitutions does not affect $\Downarrow_{a}$ or $\Longrightarrow$. For any evaluation context $\mathcal{C}$, we can safely assume that $f v(\mathcal{C}) \cap \widetilde{z}=\emptyset$. Otherwise we can choose fresh variables $\widetilde{x}$ and let $\varrho=\{\widetilde{x} / \widetilde{z}\}$ and have $A_{\backslash \widetilde{z}}=\varrho(A)_{\backslash \widetilde{x}}, B_{\backslash \tilde{z}}=$ $\varrho(B)_{\backslash \widetilde{x}}, \varrho(A) \approx^{e} \varrho(B)$. Thus we have $\mathcal{C}\left[A_{\backslash \tilde{z}}\right]=\mathcal{C}[A]_{\backslash \tilde{z}}, \mathcal{C}\left[B_{\backslash \tilde{z}}\right]=\mathcal{C}[B]_{\backslash \tilde{z}}$ and $\mathcal{C}[A] \approx^{e} \mathcal{C}[B]$. Finally $\left(\mathcal{C}\left[A_{\backslash \tilde{z}}\right], \mathcal{C}\left[B_{\backslash \tilde{z}}\right]\right) \in \mathcal{R}$.

Lemma 64. If $A \simeq B$ with $A, B$ are closed pure extended processes. Then $\mathcal{C}[A]_{\backslash \widetilde{z}} \simeq$ $\mathcal{C}[B]_{\backslash z}$ for any closing pure evaluation context $\mathcal{C}$ and $\widetilde{z} \subseteq \operatorname{dom}(A, B)$.

Proof. The proof goes by induction on the length of proof sequence for $\simeq$. When the length is 0 , the result holds trivially. For the inductive step, w.l.o.g., we assume $A \simeq D \simeq^{1} B$. As stated before, we can safely assume that $D$ is closed. By the induction hypothesis, we have $\mathcal{C}[A]_{\backslash \tilde{z}} \simeq \mathcal{C}[D]_{\backslash \tilde{z}}$. Now we will show $\mathcal{C}[D]_{\backslash \tilde{z}} \simeq \mathcal{C}[B]_{\backslash \tilde{z}}$. If the rewriting $D \simeq^{1} B$ is about restricted names or parallel composition, the conclusion clearly holds. Assume the rewriting is $D=\nu \widetilde{m} \cdot(\sigma\{M / x\}, \mathcal{P}\{M / x\}) \simeq$ $\nu \widetilde{m} \cdot(\sigma\{N / x\}, \mathcal{P}\{N / x\})=B$ with $M={ }_{\Sigma} N$. Let $\mathcal{C}=\nu \widetilde{n} .\left(\sigma^{\prime}, \mathcal{P}^{\prime}\right)$. We can safely assume that $x$ is fresh (otherwise we can use $\alpha$-conversion). Then $\mathcal{C}[D]_{\backslash \tilde{z}}=$ $\nu \widetilde{n} . \nu \widetilde{m} .\left(\sigma^{\prime} \sigma\{M / x\} \cup \sigma_{\backslash \tilde{z}}\{M / x\}, \mathcal{P}\{M / x\} \cup \mathcal{P}^{\prime} \sigma\{M / x\}\right) \simeq \nu \widetilde{n} . \nu \widetilde{m} .\left(\sigma^{\prime} \sigma\{N / x\} \cup\right.$ $\left.\sigma_{\backslash \tilde{z}}\{N / x\}, \mathcal{P}\{N / x\} \cup \mathcal{P}^{\prime} \sigma\{N / x\}\right)=\mathcal{C}[B]_{\backslash \tilde{z}}$. By transition, we get $\mathcal{C}[A]_{\backslash \widetilde{z}} \simeq$ $\mathcal{C}[B]_{\backslash \tilde{z}}$.

Proposition 65. $A_{r} \approx B_{r}$ implies $\mathcal{T}\left(A_{r}\right) \approx^{e} \mathcal{T}\left(B_{r}\right)$.

## Proof.

$$
\mathcal{S}=\left\{(A, B) \mid A \simeq \mathcal{T}\left(A_{r}\right), A_{r} \approx B_{r}, \mathcal{T}\left(B_{r}\right) \simeq B\right\}
$$

1. First we show that $A \Downarrow_{a}$ implies $B \Downarrow_{a}$. By Corollary 15 and Corollary 59 we can see that $A_{r} \Downarrow_{a}$. From $A_{r} \approx B_{r}$, we have $B_{r} \Downarrow_{a}$. Then from Corollary 59 and Corollary 15 , we have that $B \Downarrow_{a}$.
2. Assume $A \Longrightarrow A^{\prime}$ then we will show that there exists $B^{\prime}$ such that $B \Longrightarrow B^{\prime}$ and $\left(A^{\prime}, B^{\prime}\right) \in \mathcal{S}$. By Corollary 15 and Corollary 59 , we have $A_{r} \Longrightarrow A_{r}^{\prime}$ with $\mathcal{T}\left(A_{r}^{\prime}\right) \simeq$ $A^{\prime}$. From $A_{r} \approx B_{r}$, there exists $B_{r}^{\prime}$ such that $B_{r} \Longrightarrow B_{r}^{\prime} \approx A_{r}^{\prime}$. By Corollary 55 and Corollary 15, we know that there exists $B^{\prime}$ such that $B \Longrightarrow B^{\prime} \simeq \mathcal{T}\left(B_{r}^{\prime}\right)$. Hence $\left(A^{\prime}, B^{\prime}\right) \in \mathcal{S}$.
3. For any $\mathcal{C}$ we need to show that $(\mathcal{C}[A], \mathcal{C}[B]) \in \mathcal{S}$. Assume $\mathcal{C}=\nu \widetilde{l} .\left(\sigma,\left\{P_{i}\right\}_{i}\right)$. Let $\mathcal{C}_{r}=\nu \widetilde{l} .\left(\sigma\left|\prod_{i} P_{i}\right|[\cdot]\right)$. Then we can easily see that $\mathcal{T}\left(\mathcal{C}_{r}\left[A_{r}\right]\right)=\mathcal{C}\left[\mathcal{T}\left(A_{r}\right)\right]$ and $\mathcal{T}\left(\mathcal{C}_{r}\left[B_{r}\right]\right)=\mathcal{C}\left[\mathcal{T}\left(B_{r}\right)\right]$. Since $A \simeq \mathcal{T}\left(A_{r}\right)$ and $B \simeq \mathcal{T}\left(B_{r}\right)$, by Lemma 64 we have $\mathcal{C}[A] \simeq \mathcal{C}\left[\mathcal{T}\left(A_{r}\right)\right]=\mathcal{T}\left(\mathcal{C}_{r}\left[A_{r}\right]\right)$ and $\mathcal{C}[B] \simeq \mathcal{C}\left[\mathcal{T}\left(B_{r}\right)\right]=\mathcal{T}\left(\mathcal{C}_{r}\left[B_{r}\right]\right)$. Since $\approx$ is closed by evaluation context, namely $\mathcal{C}_{r}\left[A_{r}\right] \approx \mathcal{C}_{r}\left[B_{r}\right]$, we know that $(\mathcal{C}[A], \mathcal{C}[B]) \in$ $\mathcal{S}$.

Proposition 66. For two closed extended processes $A_{r}$ and $B_{r}$ in applied pi calculus [3], $\mathcal{T}\left(A_{r}\right) \approx^{e} \mathcal{T}\left(B_{r}\right)$ implies $A_{r} \approx B_{r}$.

Proof. We construct the following set

$$
\mathcal{R}=\left\{\left(A_{r}, B_{r}\right) \mid \mathcal{T}\left(A_{r}\right) \simeq \approx^{e} \simeq \mathcal{T}\left(B_{r}\right)\right\} .
$$

and we will show that $\mathcal{R} \subseteq \approx$. Assume $\mathcal{T}\left(A_{r}\right) \simeq A \approx^{e} B \simeq \mathcal{T}\left(B_{r}\right)$.

1. First we prove that $A_{r} \Downarrow_{a}$ implies $B_{r} \Downarrow_{a}$. By Corollary 55 and Corollary 15 we know that $A \Downarrow_{a}$. Since $A \approx^{e} B$, we have $B \Downarrow_{a}$. By Corollary 15 and Corollary 59 we have that $B_{r} \Downarrow_{a}$.
2. Assume $A_{r} \Longrightarrow A_{r}^{\prime}$, we need to show there exists $B_{r}^{\prime}$ such that $B_{r} \Longrightarrow B_{r}^{\prime}$ and $\left(A_{r}^{\prime}, B_{r}^{\prime}\right) \in \mathcal{R}$. By Corollary 55 and Corollary 15, we know $A \Longrightarrow A^{\prime}$ such that $\mathcal{T}\left(A_{r}^{\prime}\right) \simeq A^{\prime}$. Since $A \approx^{e} B$, we have $B \Longrightarrow B^{\prime} \approx^{e} A^{\prime}$. By Corollary 15 and Corollary 59, there exists $B_{r}^{\prime}$ such that $B_{r} \Longrightarrow B_{r}^{\prime}$ and $\mathcal{T}\left(B_{r}^{\prime}\right) \simeq B^{\prime}$. Thus $\left(A_{r}^{\prime}, B_{r}^{\prime}\right) \in$ $\mathcal{R}$.
3. For any evaluation context $\mathcal{C}_{r}$, in case the bound names are not pairwise distinct or different from the free ones, we can use $\alpha$-conversion to $\mathcal{C}_{r}\left[A_{r}\right]=\mathcal{C}_{r}^{\prime}\left[\varrho\left(A_{r}\right)\right], \mathcal{C}_{r}\left[B_{r}\right]=$ $\mathcal{C}_{r}^{\prime}\left[\varrho\left(B_{r}\right)\right]$. Then we will have a new sequence $\mathcal{T}\left(\varrho\left(A_{r}\right)\right)=\varrho\left(\mathcal{T}\left(A_{r}\right)\right) \simeq \varrho(A) \approx^{e}$ $\varrho(B) \simeq \varrho\left(\mathcal{T}\left(B_{r}\right)\right)=\mathcal{T}\left(\varrho\left(B_{r}\right)\right)$. Hence we assume that the bound names of $\mathcal{C}_{r}$ are not pairwise distinct or different from the free ones. Assume $\mathcal{T}\left(A_{r}\right)=\nu \widetilde{m}_{1} \cdot\left(\sigma_{1}, \mathcal{P}_{1}\right)$ and $\mathcal{T}\left(B_{r}\right)=\nu \widetilde{m}_{2} \cdot\left(\sigma_{2}, \mathcal{P}_{2}\right)$. By Lemma 53, we have $\mathcal{T}\left(\mathcal{C}_{r}\right)=\nu \widetilde{l}_{1}, \widetilde{l}_{2} \cdot(\sigma, \mathcal{P}), \mathcal{T}\left(\mathcal{C}_{r}\left[A_{r}\right]\right)=$ $\nu \widetilde{l}_{1}, \widetilde{l}_{2}, \widetilde{m}_{1} \cdot\left(\sigma \sigma_{1} \cup \sigma_{1 \backslash \widetilde{x}}, \mathcal{P} \sigma_{1} \cup \mathcal{P}_{1}\right)$ and $\mathcal{T}\left(\mathcal{C}_{r}\left[B_{r}\right]\right)=\nu \widetilde{l}_{1}, \widetilde{l}_{2}, \widetilde{m}_{2} \cdot\left(\sigma \sigma_{2} \cup \sigma_{2 \backslash \widetilde{x}}, \mathcal{P} \sigma_{1} \cup\right.$ $\left.\mathcal{P}_{2}\right)$. Let $\mathcal{C}=\nu \widetilde{l}_{1}, \widetilde{l}_{2} \cdot(\sigma, \mathcal{P})$. Hence $\mathcal{T}\left(\mathcal{C}_{r}\left[A_{r}\right]\right)=\mathcal{C}\left[\mathcal{T}\left(A_{r}\right)\right]_{\backslash \widetilde{x}}$ and $\mathcal{T}\left(\mathcal{C}_{r}\left[B_{r}\right]\right)=$ $\mathcal{C}\left[\mathcal{T}\left(B_{r}\right)\right]_{\widehat{x}}$. Since $\mathcal{C}\left[\mathcal{T}\left(A_{r}\right)\right] \approx^{e} \mathcal{C}\left[\mathcal{T}\left(B_{r}\right)\right]$, by Lemma 63, we have $\mathcal{C}\left[\mathcal{T}\left(A_{r}\right)\right]_{\backslash \widetilde{x}} \approx^{e}$ $\mathcal{C}\left[\mathcal{T}\left(B_{r}\right)\right]_{\backslash \widetilde{x}}$. Hence $\left(\mathcal{C}_{r}\left[A_{r}\right], \mathcal{C}_{r}\left[B_{r}\right]\right) \in \mathcal{R}$.

Theorem 21. For two closed extended processes $A_{r}$ and $B_{r}$ in applied pi calculus [3],

1. $A_{r}$ and $B_{r}$ are labelled bisimilar iff $\mathcal{T}\left(A_{r}\right) \approx_{l} \mathcal{T}\left(B_{r}\right)$.
2. $A_{r}$ and $B_{r}$ are observationally equivalent iff $\mathcal{T}\left(A_{r}\right) \approx^{e} \mathcal{T}\left(B_{r}\right)$;

Proof. This is a direct corollary of Proposition 62, Proposition 65 and Proposition 66

[^1]:    ${ }^{1}$ We omit the objects in input $u(x)$ and output $\bar{u}\langle M\rangle$ and write $u$ and $\bar{u}$ instead when the objects do not matter.

[^2]:    ${ }^{2}$ We abbreviate the set $\left\{s_{i} \mapsto M_{i} \mid i \in I\right\}$ as $\left\{s_{i} \mapsto M_{i}\right\}_{i \in I}$.

[^3]:    ${ }^{3}$ Here is a counter example: let $A_{r}=\nu c .(\bar{c} \cdot \bar{a} \mid\{c / x\})$ and $B_{r}=\nu c .(0 \mid\{c / x\})$. Obviously $A_{r}$ and $B_{r}$ are labelled bisimilar since their frames are the same and both have no transitions. However, they are not observationally equivalent. Consider the context $x(y)$, then $A_{r} \mid x(y) \Downarrow_{a}$ but $B_{r} \mid x(y) \not \psi_{a}$.
    ${ }^{4}$ We write $\sigma^{*}$ for the result of composing the substitution $\sigma$ with itself repeatedly until an idempotent substitution is reached.

[^4]:    ${ }^{5}(\widetilde{z}=\widetilde{y}) \phi\left(C_{r}^{\prime}\right)$ abbreviates $\left(z_{1}=y_{1}\right) \phi\left(C_{r}\right), \cdots\left(z_{n}=y_{n}\right) \phi\left(C_{r}^{\prime}\right)$
