Abstract

Hemispherical imagery is used in many different sub-fields of climatology to calculate local radiation budgets via sky-view factor analysis. For example, in forested environments, hemispherical imagery can be used to assess the leaf canopy, (i.e. leaf area / gap fraction) as well as the radiation below the canopy structure. Nikon Coolpix cameras equipped with an FC-E8 fisheye lens have become a standard device used in hemispherical imagery analysis however as the camera is no longer manufactured, a new approach needs to be investigated, not least to take advantage of the rapid development in digital photography over the last decade. This paper conducts a comparison between a Nikon Coolpix camera and a cheaper alternative, the Raspberry Pi NoIR camera, to assess its suitability as a viable alternative for future research. The results are promising with low levels of distortion, comparable to the Nikon. Resultant sky-view factor analyses also yield promising results, but challenges remain to overcome small differences in the field of view as well as the present availability of bespoke fittings.

Key words: Hemispherical fisheye, Near infra-red, Raspberry Pi, Sensors

1. Introduction

Hemispherical imagery is commonly used to assist in the assessment of radiation budgets. Examples of use include below tree canopies, in urban areas or within riverine environments (*Hall et al.*, 2017; *Liu et al.,* 2015; *Chapman, 2007*; *Chapman et al*; 2007; *Bréda,* 2003; *Ringold et al.,* 2003; *Watson and Johnson*, 1987). Imagery is usually obtained using a camera equipped with a fisheye lens (Figure 1a) which allows the camera to take an approx. 180° hemispherical image *(Liu et al., 2015; Chianucci et al., 2015).* These images are then processed to analyse the amount of

Comment [JK1]: Removed resolution comment

42   visible sky shown in the image (known as the sky-view factor). This can then be used

43   in forestry research to quantify the health of a tree and to compare differences

44   between tree canopies *(Schwalbe et al., 2009; Leblanc et al., 2005 Jonckheere et al.*

45   *2004).*

48   1850 fisheye camera attached to a Samsung Galaxy S5 Neo; (c) Perspex Dome

49   used to measure distortion.

50   The use of fisheye imagery for this application can be dated back to the early work of

51   Anderson (1964), but it was the advent of digital photography which saw the

52   approach become widely adopted. Following a number of scoping studies, which

53   successfully compared results obtained from film cameras to the new generation of

54   digital cameras (*Englund et al. 2000; Frazer et al. 2001; Hale and Edwards, 2002),*

55   the new technology quickly became adopted by the scientific community. However,

56   following the successful transition to mass digital photography, studies for the past

57   two decades have become very reliant on the early digital cameras produced by

58   Nikon (**Error! Reference source not found.**) such as the Coolpix 950 or 4500

59   *(Chianucci et al. 2016; Lang et al., 2010; Chapman, 2007; Zhang et al., 2005; Baret*

60   *and Agroparc, 2004; Ishida, 2004).* Indeed, whilst research into hemispherical

61   imagery has also been conducted using alternative cameras and equipment (Table

62   2**Error! Reference source not found.**), the Nikon Coolpix range equipped with the

63   FC-E8 fisheye lens undoubtedly remains the most popular choice in research to

64   date.

Seasonal Changes in Canopy Structure	
Liu et al., 2015	Used a Nikon Coolpix 4500 camera at sunset / sunrise to capture hemispherical images of tree canopies in order to investigate seasonal changes of tree canopies.
Comparing Nikon Coolpix to film cameras and Leaf canopy analysers	
Homolová et al. 2007	Used a Nikon Coolpix 8700 to compare canopy analysers to hemispherical imagery.
Garrigues, et al., 2008	Compares Nikon Coolpix 990 with LAI-2000 and AccuPAR.
Frazer et al., 2001	Compared a Nikon 950 to a film camera and highlighted the potential for blurred edges and colour distortion of a Coolpix camera but noted it can be used in calculating canopy gap measurements.
Englund et al., 2000	Compared a digital Nikon 950 and a film camera to find that low resolution images from the Nikon 950 were an adequate comparison to film cameras.
Grimmond et al., 2001	Compared a Nikon 950 Coolpix to a plant canopy analyser and found that the Nikon was an effective and easy approach to canopy analysis.

Gap function Analysis and Estimation of tree canopies	
Hu et al., 2009	Uses a Nikon 950 Coolpix camera to take hemispherical images to calculate gap size and shape within a tree canopy.
Gap function Analysis and Estimation of tree canopies	
Zhang et al., 2005	Researched the effect of exposure on calculating the leaf area index and gap function analysis using a Nikon Coolpix 4500.
Lang et al., 2010	Calculated gap function of canopies using a Nikon Coolpix 4500 and compared it to the Canon EOS 5D cameras.
Chianucci et al. 2016	Used a Nikon 4500 to compare gap functions in forested canopies.
Danson et al., 2007	A Nikon 4500 was used as a comparison to terrestrial laser scanning.
Adaption or calibration of Nikon cameras	
Chapman, 2007	Adapted a Nikon 4500 camera to make in near infra-red in order to better estimate sky-view factors and the woody bark index of tree canopies.
Baret, & Agroparc, 2004	Used a Nikon 4500 in order to determine the optical centre of an image using a fisheye lens.
Ishida, 2004	Created threshold software for colour images from a Nikon 950 camera.

65 Table 1 List of sample studies that use Nikon Coolpix cameras.

66

Studies	Camera used	Approach
Kelley and Krueger, 2005	HemiView 2.1 digital image system	Used a 20-megapixel SLR CMOS camera as part of the HemiView software (Delta Devices 2017) to record canopy structure in riparian environments
Duveiller and Defourny, 2010	Canon PowerShot A590 camera	Used a Canon PowerShot A590 camera to assess batch processing of hemispherical images
Rich, 1990	Canon T90 Minolta X700 Nikon FM2 Olympus OM4T	Comprehensive instructions on how to take hemispherical photography with a list of cameras suitable for research
Urquhart, et al., 2014	Allied Vision GE-2040C camera	Uses sky-view factors from a high dynamic range camera to calculate short term solar power forecasting
Wagner and Hagemeier, 2006	Canon AE-1 camera	Used a Canon camera to estimate leaf inclination angles on tree canopies

67   Table 2 Studies using alternative cameras for hemispherical photography.

68

69   The Nikon Coolpix range of cameras remains a key tool in forest climatology (**Error!**

70   **Reference source not found.** and Table 2**Error! Reference source not found.**).

71   Unfortunately, the Coolpix range is no longer readily available (*Nikon, 2016*) with

72   digital camera technology advancing considerably in the interim making models such

as the Coolpix 4500 camera appear large and bulky with a relatively poor battery life and low image resolution (3.14 megapixels). However, even today, the FC-E8 fisheye lens remains one of the least distorted on the market (*Holmer* et al., 2001) and as such, the camera series remains very popular with researchers as a tried and tested means to collect hemispherical imagery *(Chapman, 2007).* A significant further advantage of the Coolpix range of cameras was the ability to easily convert the camera to take near infra-red (NIR) imagery. By adapting a camera in this way, it significantly enhances its functionality in the forest environment as due to the highly reflective nature of vegetation it becomes easier to distinguish this from woody elements and other features in imagery when taken in NIR; which can then be used to assess the health and density of tree canopies *(Chen et al.,* 1996; *Turner et al.,* 1999).

Overall, the Nikon Coolpix camera has reached the point where it is informally viewed as a standard device for this purpose, but with dwindling numbers now available for purchase on internet auction sites, there is a need to investigate new and more sustainable means to collect data in the long term. Whilst new digital cameras are available on the market, the approach explored in this paper is to investigate whether a low-cost alternative can be developed using readily available off-the-shelf components.

2. Methods

2.1 Adapting a Raspberry Pi

The Raspberry Pi is a range of small computers designed to minimise the cost of computing and thus make it, and computer programming more generally, accessible to a wide audience. After a prolific launch, it now has a worldwide following of

97 developers focussed on producing generic code and peripherals for use in a range of

98 applications. As an example, the computer can now be readily fitted with a

99 Raspberry Pi camera and subsequently programmed to take images at set time

100 intervals.

101 At the time of writing, the most popular Pi compatible camera available on the market

102 is the Pi camera which comprises of a Sony IMX219 9-megapixel sensor. This is

103 available either as a standard device or as a Pi NoIR camera where the infra-red

104 blocking filter (needed by modern digital cameras due to the inherent capability to

105 see beyond the visible spectrum: *Chapman, 2007*) has been removed (*Raspberry Pi,*

106 *2016*). As outlined in the previous section, NIR capability improves the utility of the

107 approach for use in forested environments.

108 **2.2 Comparison of Fisheye lenses**

109 Unfortunately, a fisheye lens is presently not available that has been specifically

110 designed for the Pi NoIR camera. However, due to the recent proliferation of

111 smartphone photography, there is a wide range of fisheye lenses that are now

112 available for smartphones which have the potential to be used. The key

113 consideration here, as per Holmer et al, (2001), is to select a lens with minimal

114 distortion to reduce error in later image analyses. This can be achieved by testing

115 the equiangularity of the lens by calculating any distortions in the radial distance. As

116 shown in Figure 2, the aim is to acquire an image where the radial distance is

117 directly proportional to the zenith angle (*Chapman*, 2008).

118

(a)

(b)

(c)

(d)

(e)
119   Figure 2 (a) Visual comparison of Nikon Coolpix camera, (b) smart phone camera

120   with attached 185˚ fisheye lens, (c) smart phone camera with attached fisheye lens

121   198˚, (d) smart phone camera with attached fisheye lens 180˚ and (e) smart phone

122   camera with attached fisheye lens 235˚

123

124   A range of available fisheye lenses were tested for distortions (Table 3). In this initial

125   test, the fisheye lenses were clipped onto a Samsung Galaxy S5 Neo (Figure 1 b)

126   and placed under a large Perspex calibration dome marked at equal points along the

127   sides using a compass (Figure 1 c). A plumb bob was then used to position the

128   device directly below the centre of the dome before a series of images collected

129   (Figure 2). Measurement distortions were then calculated using Image-J software

130   (Figure 3).

131

Product	Field of view	Cost (At time of writing)
Yarrashop fisheye lens	180	£7.99
First2Savv JTSJ-185-A01 fisheye lens	185	£8.99
AUKEY fisheye lens	198	£11.99
MEMTEQ universal fisheye lens	235	£10.99

132   Table 3 Mobile fisheye lenses specification.

133

134
Figure 3 Comparison of radial distortion between different mobile fisheye lenses and

Nikon Coolpix 4500 camera FC-E8 lens.

137

138 The results show that the 185° fisheye lens (Figure 2b) is most comparable with the

139 Nikon Coolpix FC-E8 lens (Figure 2a). It has a similar field of view (FOV) and

140 despite a slight reduction in image clarity at high radial distances, the 185° lens has

141 the lowest level of distortion (Figure 3). However, comparisons between the Nikon

142 Camera FC-E8 lens and other mobile fisheye lenses are not as favourable and all

143 display clear distortions and/or significant reductions in FOV. For example, the 180°

144 (Figure 2d) camera captures the lowest FOV of the compared fisheye lenses (Figure

145 3). The 198° fisheye lens (Figure 2c) has excellent clarity at high radial distances

146 however has a lower FOV then reported and high levels of distortion (Figure 3).

147 Conversely, the 234° fisheye lens (Figure 2e) has a high FOV however has high

148 levels of distortion, especially at high radial distances (Figure 3). Based on these

149 analyses, the 185° fisheye lens was chosen for further investigation.

150 **2.3 Adapting a Pi Noir camera to take hemispherical images**

151 In order to use the 185° fisheye lens with the Pi NoIR camera, a series of small

152 adaptations are required. Whilst these adaptations could be achieved using 3D

153 printing technology, this was achieved in this study using parts scavenged from the

154 First2Savv 185º fisheye lens (Figure 4**Error! Reference source not found.**a) and

155 tubing from a Waveshare Raspberry Pi Camera Module Kit (Figure 4b). The camera

156 component of the Waveshare kit was removed, using a saw and drill, to leave a

157 hollow tube. The tubing (Figure 4b) was then tied and secured to the base of the

158 Raspberry PI NoIR camera using thin wire (Figure 4c). The camera was then

159 attached to the Raspberry Pi board using the connector port (Figure 4d).

(a)   (b)

(c)   (d)
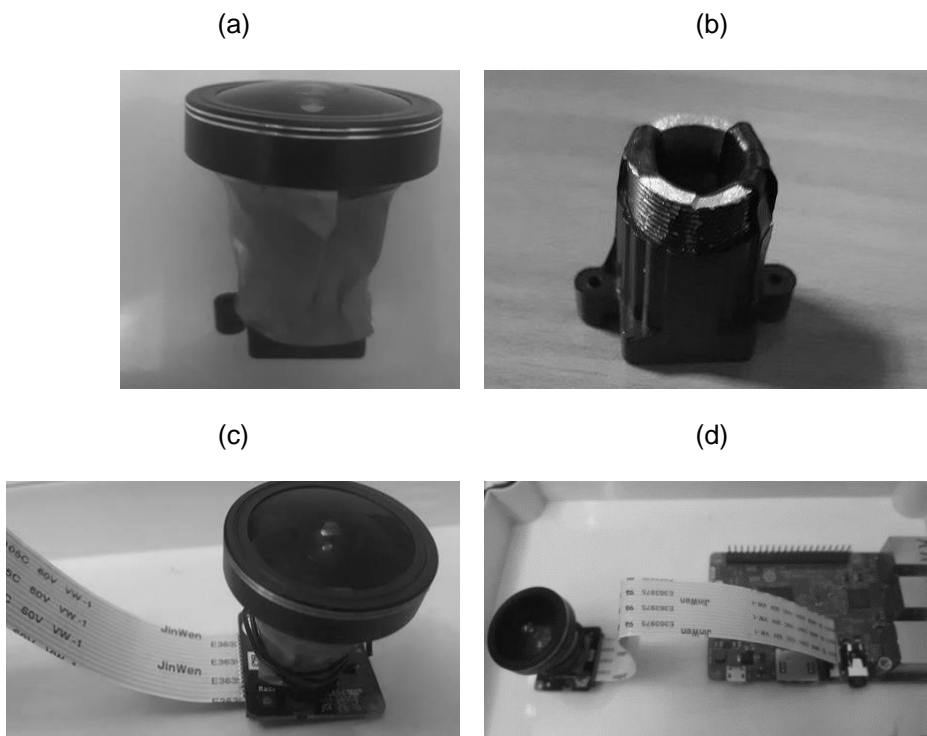

160   Figure 4 (a) 185° fisheye lens attached to base (b) base component of Raspberry Pi

161   fisheye module, (c) fisheye module attached to Raspberry Pi NoIR camera (d)

162   Camera module attached to a Raspberry Pi computer.

163

164   **3. Comparison of Nikon camera and Pi NoIR Raspberry Pi camera.**

165   **3.1 General Specifications**

166   Table 4 shows the specification comparison of both the Pi NoIR camera version 1

167   and 2, the Nikon Coolpix 4500 and the Nikon Coolpix 9000 camera. As has been

168   demonstrated in the previous section, the reported FOV can vary with individual

169   cameras (*Grimmond et al.,* 2001) and therefore this has been estimated in this study

170   using a mechanical clinometer. The adapted Pi camera FOV (164°) is less than the

Comment [JK2]: Removed resolution argument

171 Nikon Coolpix FOV (176°) which is hypothesised to be a consequence of the added

172 tubing (Figure 4b) causing some distortion and loss of image at ground level.

	Nikon 900	Nikon 4500	Pi NoIR V1	Pi NoIR V2

174 Table 4 Comparison of Coolpix cameras to Raspberry Pi cameras

175

176   **3.2 Distortion Analysis**

177 As hemispherical imagery is mostly used in the analysis of tree canopies, the loss of

178 information at ground level (i.e. high radial distances) is less of a concern. It is at

179 these extremities of the image where distortions are also more common and indeed

180 one of the main attractions of the Nikon Coolpix range of cameras (*Holmer et al.*,

181   2001). Whilst an equiangular lens is not an essential requirement of a camera

182   system for this application, it does ensure fewer corrections are required and

183   minimises error in subsequent analysis. The distortions of the adapted fisheye lens

184   are again tested by using the Perspex calibration dome (Figure **5**).

(a)   (b)
185   Figure 5 (a) Nikon Coolpix camera in a Perspex dome and (b) Raspberry Pi NoIR

186   camera with fisheye attached under Perspex dome.

187

188   The FOV of the adapted Pi camera is demonstrated to be less than the Nikon

189   camera however there is a greater level of distortion when using a Nikon Coolpix

190   camera (

191). This difference is likely due to the size of the equipment with the Nikon Coolpix

192 camera being larger in size than the Pi camera lens (145 mm compared to 25mm).

193 With respect to equiangularity, there is a strong correlation between radial distance

194 distortions of the Nikon Coolpix FC-E8 lens camera and Raspberry Pi NoIR adapted

195 fisheye camera at 99.9% confidence level (

196　).

197

211　(sky) in each annulus and summed (*Holmer et al. 2001*; *Johnson and Watson, 1984;*

212 *Steyn 1980).* Analyses were performed on the original imagery as well as images

213 cropped to have the same FOV. Table 5 shows that when the FOV is uncorrected,

214 the Pi overestimates the sky-view factor, but when this is corrected, the output is

215 very similar and is significant at the 99.9% level.

216
217 Figure 7 Visual variations in sky-view factors when comparing a Nikon Coolpix FC-
218 E8 lens with a 185° Raspberry Pi NoIR camera.

220 Table 5 Sky view factors of Nikon Coolpix camera adjusted FOV, Raspberry Pi NoIR
221 camera, Nikon Coolpix unadjusted FOV and Raspberry Pi leaves only images.
222

223 **3.4 Near Infrared Capabilities**

224 In addition to hardware availability, the advantages of using a Raspberry Pi NoIR
225 camera over a Nikon 4500 camera is the in-built near infra-red (NIR) technology.

226 Although it is also possible to convert the Nikon Coolpix camera to take NIR images

227 (*Chapman*, 2007), this involves substantial effort which risks damaging the camera.

228 **The capability of the Pi NoIR was confirmed in this study. A simple threshold**

229 **analysis proved sufficient to remove all other aspects of the image except for**

230 **vegetation (**

| Nikon Coolpix FC-E8 Lens | Nikon Coolpix FC-E8 Lens SVF | Raspberry Pi Camera | Raspberry Pi Camera SVF | Raspberry Pi Camera – After Threshold Analysis | Raspberry Pi Camera – Leaves only SVF |

(a) (b) (c) (d) (e) (f) (g) (h)

231

232 Figure **7**Table 5). The differences in sky-view factor can then be calculated; from

233 this a leaf-view calculation were made and presented in Table 5, indicating an

234 approximation of leaf cover in the image and further highlights the utility of the

235 camera in forestry applications.

4. Conclusions

237 The Nikon Coolpix camera range has provided a reliable 'standard' solution for

238 obtaining hemispherical fisheye imagery for many years. However, whilst still fit for

239 purpose, an alternative is needed to ensure a sustainable means of data collection

240 moving forward. This paper has shown that comparable results can be provided with

241 a low-cost image collection system using readily available components.

242 The Pi NoIR camera provides an off-the-shelf NIR solution, making it perfect for use

243 in forested environments and thus removing the need for further adaptation (i.e.

244 removal of blocking filters and addition of cold mirrors: *Chapman, 2007*). However,

245 fisheye lenses are not yet readily available and hence there is presently a need to

246 carry out alternative adaptations such as those outlined in this paper, or the use of

247 simple 3D printing technology. However, the most positive result from this study is

248 the direct comparability of the imagery (and subsequent results from sky-view factor

249 analyses) obtained from the two techniques. Both systems have similarly low levels

250 of distortion, but there are minor differences in relation to the FOV. Further research

251 is needed to adapt the Raspberry Pi to make the sensor usable in the field; this

252 includes waterproofing the technology and testing the equipment at various

253 temperature ranges. A limitation of this study is that the technology was not tested

254 for interference from electronic or radio waves.

255

Comment [JK5]: Removed resolution comment

256 Further advantages of the Raspberry Pi approach are the computing capability of the

257 device, which means it has internal logging capabilities and (once waterproofed)

258 could be left in the field in time lapse mode for long periods at a time, even relaying

259 imagery over the internet in real-time if communications are available. Overall,

260 moving forward there are many advantages to using the Raspberry Pi, however the

261 key conclusion is that a fit for purpose and dynamic solution for the collection of

262 hemispherical imagery can be readily produced at a low cost.
