1 **ABSTRACT**

2
3 **Background:** Formative colonoscopy direct observation of procedural skills (DOPS) assessments were
4 updated in 2016 and incorporated into UK training but lack validity evidence. We aimed to appraise
5 the validity of DOPS assessments, benchmark performance and evaluate competency development
6 during training in diagnostic colonoscopy.
7

8 **Methods:** This prospective national study identified colonoscopy DOPS submitted over an 18-month
9 period to the UK training e-portfolio. Generalisability analyses were conducted to evaluate internal
10 structure validity and reliability. Benchmarking was performed using receiver operator characteristics
11 (ROC) analyses. Learning curves for DOPS items and domains were studied and multivariable analyses
12 performed to identify predictors of DOPS competency.
13

14 **Results:** Across 279 training units, 10749 DOPS submitted for 1199 trainees were analysed. The
15 acceptable reliability threshold ($G > 0.70$) was achieved with 3 assessors performing 2 DOPS each.
16 DOPS competency rates correlated with the unassisted caecal intubation rate ($\rho = 0.404$, $P < 0.001$).
17 Demonstrating competency in 90% of assessed items provided optimal sensitivity (90.2%) and
18 specificity (87.2%) for benchmarking overall DOPS competence. This threshold was attained in the
19 following order: 'pre-procedure' (50-99 procedures), 'endoscopic non-technical skills' and 'post-
20 procedure' (150-199), 'management' (200-249) and 'procedure' (250-299) domain. At item-level,
21 competency in 'proactive problem solving' ($\rho = 0.787$) and 'loop management' ($\rho = 0.780$) correlated
22 strongest with the overall DOPS rating ($P < 0.001$) and were the last to develop. Lifetime procedure
23 count, DOPS count, trainer specialty, easier case difficulty and higher caecal intubation rate were
24 significant multivariable predictors of DOPS competence.
25

26 **Conclusion:** This study establishes milestones for competency acquisition during colonoscopy training
27 and provides novel validity and reliability evidence to support colonoscopy DOPS as a competency
28 assessment tool.
29

1 **WHAT IS NEW HERE**

2

3 **What is known**

- 4 • Standardised, validated, competency-assessment tools in colonoscopy training are
5 lacking.

6

7 **What is new here**

- 8 • The DOPS can be used to measure development of individual competencies.
9 • Competency in DOPS mirrors the unassisted caecal intubation rate.
10 • DOPS is a valid and reliable tool which can be used to support colonoscopy training.

11

1 **INTRODUCTION**

2 Globally, renewed commitments towards the quality assurance of colonoscopy has led to a modern-
3 day shift in the paradigm of colonoscopy training. The era of competency-based medical education
4 has drawn competency evaluation away from merit based on numbers and towards continuous and
5 objective evaluation of competence using standardised assessment tools.^{1,2} There is an increasing
6 expectation for training programmes to set competency benchmarks, facilitate objective and
7 standardised assessment of competence, and to monitor and ensure competency development during
8 training.³ The implementation of objective, valid and reliable competency-assessment tools are
9 necessary to support the delivery of this concept.⁴

10

11 The UK is one of the first countries to implement standardised assessment in colonoscopy. The Joint
12 Advisory Group on Gastrointestinal Endoscopy (JAG),⁵ the national quality assurance body for
13 endoscopic procedures, supported the development of direct observation of procedural skills (DOPS)
14 as an assessment tool. The first colonoscopy DOPS was developed in 2004 by a multidisciplinary panel
15 of experts using a hierarchical task analysis format.⁶ Over the years, the colonoscopy DOPS
16 assessment form has undergone several iterations in response to feedback. In 2016, all DOPS
17 assessment forms were modified to include: 1) revisions to the items and descriptors, 2) change in the
18 scoring from a competency-based to supervision-based scale, and 3) the addition of a generic
19 endoscopic non-technical skills assessment domain, which have improved the validity of competency
20 assessments.⁷ The current formative DOPS for colonoscopy (**Supplementary File 1**) contains 24 items,
21 split into 5 domains, and an overall assessor rating.⁸ The DOPS is accompanied by item descriptors
22 (**Supplementary File 2**) which serve to facilitate objectivity of assessment.

23

24 Formative DOPS are completed by trainers after directly observing the performance of a trainee.
25 DOPS are entered onto a national web-based system, implemented in 2009 for trainees to record
26 endoscopy experience and assessment data - the JAG Electronic Training System (JETS) e-portfolio.⁹

1 Formative DOPS are defined by their purpose, i.e. assessments which highlight specific areas for
2 development and monitor progress longitudinally. For trainees in the later-stages of training,
3 formative assessments may also be used to gauge readiness for formal summative assessment, a
4 gateway step for independent practice. The JAG criteria for provisional colonoscopy certification and
5 suitability for independent colonoscopy practice comprise: lifetime colonoscopy count ≥ 200 ,
6 unassisted caecal intubation rate $\geq 90\%$ over the preceding 3 months, attendance of the JAG basic skills
7 course in colonoscopy, and competency in the preceding 5 formative DOPS, as determined by each
8 DOPS scoring $\geq 90\%$ competency in assessed items.^{10,11} Validity and reliability data for the previous
9 iteration of colonoscopy DOPS had been reported,⁶ but in the context of summative assessments for
10 Bowel Cancer Screening accreditation (asymptomatic guaiac-positive patients). The study did not
11 report on the benchmarking of outcomes and involved assessors who received five hours of dedicated
12 DOPS training, which would be unfeasible to implement nationally. Thus, a study involving the
13 updated DOPS in the formative (in-training) environment remains warranted. Given that each DOPS
14 assesses up to 24 individual competencies, analyses of DOPS from a national training cohort can
15 provide the granularity to study the development of specific technical, cognitive and generic non-
16 technical skills during colonoscopy training. Such data may enable training programmes to benchmark
17 performance and determine competency milestones.

18

19 In this national study involving DOPS assessments of colonoscopy trainees, we aimed to: i) assess the
20 validity and reliability of formative DOPS, ii) analyse DOPS data to benchmark competence and
21 evaluate competence development during training, and iii) identify independent predictors of DOPS
22 competence.

23

24

25 **METHODS**

26 **Study Design**

1 This prospective, observational UK-wide study identified updated formative colonoscopy DOPS
2 submitted onto the JETS e-portfolio over the 18-month period between July 2016-January 2018.
3 Under JAG recommendations, the trainer's decision to perform a DOPS assessment is made prior to
4 commencing a procedure and without the knowledge of the trainee, in order to minimise case-
5 selection bias. Summative colonoscopy DOPS performed over this period were separately appraised.¹²

6

7

8 **Factors Studied**

9 For each DOPS completed, the following data were systematically collated: the individual item scores,
10 case difficulty and overall DOPS rating awarded by the assessor/trainer. Other covariates studied
11 included: the trainee and assessor identifier, trainee grade, lifetime colonoscopy count immediately
12 preceding the DOPS assessment, lifetime sigmoidoscopy count, gastroscopy certification status,
13 lifetime DOPS count and the unassisted caecal intubation rate calculated over the preceding 30
14 procedures.¹⁰ Lifetime procedure counts were derived from trainee-entered procedures logged onto
15 the JETS e-portfolio.

16

17 In the UK, the vast majority of all colonoscopy procedure are performed by three main specialties:
18 gastroenterologists, GI surgeons and non-medical (nurse) endoscopists.¹³ Gastroenterology specialty
19 training currently lasts five years and runs concurrently with training in acute general medicine and
20 on-call commitments. In surgery, lower gastroenterology training is a sub-speciality block within a
21 longer more general surgical training programme. In gastroenterology, all training is usually
22 associated with some commitment to general medical support throughout their training. Speciality
23 training grades range from years 3 to 7 (ST3-7) and training in GI surgery lasts six years (ST3-8). It is
24 possible to take time out at any stage of training for dedicated research, i.e. clinical research fellow
25 role. Certification in colonoscopy is not a requirement for completion of specialist training and may

1 be continued upon completion as a consultant. Thus, for the purpose of analysis, ST3-5 grades were
2 classified as junior, ST6+ as senior, and clinical research fellow treated as a separate category.

3

4

5 **Outcomes**

6 The primary outcome studied was the overall DOPS rating, which was awarded independent of the
7 DOPS items scores and rated on a 4-point ordinal scale (**Supplementary File 3**).⁸ These were converted
8 to a 4 point numerical scale to facilitate analyses: Score 1: requiring maximal supervision; Score 2:
9 significant supervision; Score 3: minimal supervision; Score 4: competent without supervision.
10 Endoscopic competence was defined as the ability to perform a procedure in an effective, safe and
11 timely manner. Items could be rated “not applicable” (N/A) if assessment was possible. N/A scores
12 were excluded from item and domain-level analyses. The percentage of items scoring competent
13 (Score 4) for each DOPS and domain (pre-procedural, technical, post-procedural and ENTS) were
14 adopted as the secondary outcome.

15

16

17 **Statistical Analyses**

18 *Item-total correlations*

19 Item-total analyses can be used to indicate internal structure validity by indicating differences in
20 magnitude of correlation between each DOPS item and the overall DOPS score. Analyses were
21 performed using Spearman’s rank tests, with rho coefficients ≥ 0.70 regarded as a strong positive
22 correlation.

23

24 *Generalisability Theory*

1 The reliability of DOPS assessments was evaluated using generalisability theory, a statistical
2 framework which applies variance component analysis to determine the influence of independent
3 variables on assessment outcomes, i.e. overall DOPS score.^{14,15} For this assessment design, the key
4 variance components are: trainee ability (across all assessors and cases: V_{trainee}), assessor stringency
5 (across all trainees and cases: V_{assessor}), assessor subjectivity attributable to the trainee ($V_{\text{assessor}*\text{trainee}}$),
6 and residual variance (V_{error}), most of which will be trainee case-to-case variation. This enables
7 generalisability coefficients (G) to be calculated as a function of the number of cases and assessors.
8 The G-coefficient is calculated using the same general equation as a reliability coefficient ($G = \text{trainee}$
9 $\text{variance} / [\text{trainee variance} + \text{error variance}]$), with values ≥ 0.70 considered of acceptable reliability
10 for in-training assessments.

11

12 *Benchmarking Competency*

13 Competency benchmarks were derived from receiver operating characteristics (ROC) curve analyses
14 to determine the optimal percentage of competent items per DOPS in relation to overall DOPS
15 competency. The value providing optimal sensitivity and specificity was calculated using Youden's
16 index (sensitivity + specificity - 1).¹⁶

17

18 *Competency Development*

19 To estimate competency development (learning curves), the percentage of competent scores were
20 calculated for each item, domain and global measure (overall assessor rating and percentage of
21 competent items per DOPS), and stratified by lifetime procedure count. The lifetime procedure counts
22 required to reach the competency benchmark score was used to estimate when trainees develop
23 specific competencies as measured within DOPS.

24

1 *Predictors of DOPS Competence*

2 Multivariable analyses using a binary logistic regression approach were then performed to identify
3 independent factors associated with DOPS competence (overall DOPS outcome of 4). Generalised
4 estimating equations (GEE) with an autoregressive (AR1) structure were used to account for the non-
5 independence of trainee procedures. DOPS with missing data and those performed by NME trainees
6 were excluded from analyses, as unlike other specialties, NME trainees are usually trained to deliver
7 independent sigmoidoscopy practice, e.g. in Bowel Scope screening, before training in colonoscopy,
8 and such data may not be captured on the JETS e-portfolio.

9

10 Statistical analyses were performed in SPSS (v24, Armonk, NY: IBM Corp), with $p < 0.05$ indicative of
11 significance throughout.

12

13

14

15 **RESULTS**

16

17 **Participants**

18 During the study period a total of 10749 DOPS were included for analysis. DOPS were submitted by
19 1399 trainers (median 4 DOPS per trainer; IQR 2-9) for 1199 trainees (median 5 DOPS per trainee; IQR
20 2-13), within 279 UK endoscopy training units. Trainee characteristics are summarised in **Table 1**.
21 Those within the NME specialty had performed more flexible sigmoidoscopy procedures ($P < 0.001$)
22 prior to DOPS assessments (median 92, IQR: 20-265) than gastroenterology (median 44, IQR 44-133)
23 and GI surgery trainees (median 51, IQR 17-104).

24

25

26 **Item-Total Correlations**

1 Item-total correlations were conducted to assess the relationship between the performance of each
2 DOPS item and the overall competency rating. This showed positive and significant correlations
3 ($P < 0.001$) for all items (**Table 2**). Item-total correlations were weakest for items located within the
4 'pre-procedure' domain, and strongest for those within the 'procedure' domain, particularly for
5 'proactive problem solving' (rho 0.787), 'loop management' (rho 0.780), 'pace and progress' (rho
6 0.734) and 'tip control' (rho 0.719).

7

8

9 **Sources of Variance**

10 Variance component analysis yielded the following estimates of the effect of key variables on the
11 overall DOPS assessor rating: trainee ability (38%), assessor stringency (17%), assessor subjectivity
12 attributable to the trainee (12%) and residual variance (34%).

13

14

15 **Reliability**

16 Combining the variance estimates based on generalisability theory, the reliability of formative DOPS
17 was modelled from different combinations of trainers and observations (**Table 3**). 6 observations (≥ 2
18 DOPS each from 3 different assessors) was sufficient to achieve the reliability threshold of 0.70 for in-
19 training assessment.

20

21

22 **Competency Thresholds**

23 ROC analysis (**Figure 3**) showed that overall competency for an assessed procedure could be predicted
24 by each component assessed item within DOPS, i.e. based on the percentage of items rated as
25 competent within each DOPS (area under ROC: 0.956, $P < 0.001$). Attainment of competency in 90% of
26 assessed DOPS items yielded optimal sensitivity (90.2%) and specificity (87.2%) for predicting overall

1 competence, with corresponding false positive and false negative rates of 12.8% and 9.8%
2 respectively. The DOPS competency rate of 90% was therefore set as the benchmark for delineating
3 competence.

4
5

6 **Competency Development during Colonoscopy Training**

7 Across the cohort, DOPS performance, as measured by the mean percentage of competent scores for
8 each item (**Table 4**) and domain (**Figure 1**), was presented by strata of lifetime procedure count.
9 Considering all DOPS items, the 90% competency threshold was achieved after 200-249 procedures.
10 Trainees first developed competencies in the “pre-procedure” domain, in the item order of “consent”,
11 “preparation” and “equipment check” (50-99 procedures), before other “pre-procedure” items (100-
12 149 procedures). Competency development profiles for “post-procedure” and “ENTS” domains were
13 similar and developed after 150-199 procedures. This was followed by competence in the
14 “management” domain and in the “leadership” and “judgement and decision making” items within
15 the ENTS domain (200-249 procedures). Finally, proficiency in the “procedural” domain were attained
16 after 250-299 procedures. At item-level, competencies in “air management”, “visualisation”, “patient
17 comfort” and “scope handling” were achieved by 200-249 procedures. After 300 procedures, the
18 competency threshold was reached for “tip control” (90.8%) and “pace and progress” but not for
19 “proactive problem solving” (88.1%) and “loop management” (86.1%). Competency development
20 profiles did not vary by case difficulty (**Supplementary File 4**), although more complicated cases were
21 associated with lower rates of competent item scores within the “procedure” domain. Comparisons
22 between trainee specialties for each block of lifetime procedure count (**Supplementary Files 5-7**)
23 suggest that surgical trainees are more likely to be awarded DOPS competency than gastroenterology
24 counterparts.

25

1 Trainees achieved the median unassisted CIR target of 90% after 200-249 procedures (**Figure 2**);
2 moderately positive correlation was observed between CIR and DOPS performance (rho 0.404,
3 P<0.001).

4
5

6 **DOPS Competency**

7 On multivariable GEE analysis (**Table 5**), lifetime procedural count (P<0.001), case difficulty (P<0.001),
8 lifetime colonoscopy count (P<0.001), lifetime colonoscopy DOPS count (P=0.002), and higher
9 unassisted caecal intubation rate (P<0.001) were independently associated with DOPS competence.
10 There was a direct relationship between assessor specialty and DOPS competence (P=0.002). After
11 accounting for these factors, trainee specialty (P=0.665), trainee seniority (P=0.220), gastroscopy
12 certification (P=0.161) and lifetime flexible sigmoidoscopy count (P=0.681) were not significantly
13 associated with DOPS competence.

14

15 Over the study period, 184 trainees (gastroenterologist: 78; gastrointestinal surgeon: 68; non-medical
16 endoscopist:35) applied for summative DOPS assessments for provisional colonoscopy certification
17 after meeting eligibility criteria. The median lifetime colonoscopy count prior to summative
18 assessment was 236 (IQR 211-285), with no significant differences between the three specialties
19 (P=0.210). In total, 183 of the 184 trainees (99.5%) were deemed competent over the 4 summative
20 DOPS assessments and were awarded certification for independent colonoscopy practice.

21
22
23

24 **DISCUSSION**

25 In this prospective nationwide study of colonoscopy DOPS assessments undertaken within 279 UK
26 training centres, we present validity and reliability data to support the use of colonoscopy DOPS as an
27 in-training assessment tool. Based on Messick's contemporary framework for evaluating validity in

1 assessment tools,^{17,18} internal structure evidence (associations between test measures and reliability)
2 was supported through item-total correlations and generalisability theory analyses, while learning
3 curves and the observation that DOPS performance closely mirrors the unassisted CIR provides
4 discriminative validity (relations to other variables). ROC analyses showed that all items measured
5 within each DOPS could be accommodated to predict overall competence (AUROC=0.956); the
6 evaluation of a competency threshold and its false positive and false negative rates attests to
7 consequential validity (value implications of interpreting test scores). Content validity (relevance) may
8 be inferred from the multidisciplinary nature of DOPS construction and the improvement in the DOPS
9 rating scale,⁷ whereas response process validity (relationship between intended construct and
10 thought processes of assessors) stems from high trainer satisfaction reported with the previous
11 iteration of colonoscopy DOPS.⁶

12

13 Over the last decade, a number of competency assessment tools have been developed and validated
14 to support colonoscopy training.^{2,3,19} The Assessment of Competency in Endoscopy (ACE) tool,²⁰ which
15 succeeded the Mayo Colonoscopy Skills Assessment Tool (MCSAT), is currently used in North
16 America.²¹ ACE measures 14 competency items and awards overall scores for technical and cognitive
17 skills on a performance-based scale ranging from 1 (novice) to 4 (highly-skilled). Following the analysis
18 of 1061 ACE assessments for 93 fellows, an overall score of 3.5 was reported as the optimal
19 competency threshold; this was attained for cognitive endpoints before technical skills, with
20 competency achieved in nearly all items after 250 procedures.²² The Gastrointestinal Endoscopy
21 Competency Assessment Tool (GIECAT),²³ and more recently SAFE-T,²⁴ have also been introduced and
22 supported by validity and reliability data, but not have been incorporated into national endoscopy
23 training systems as with the DOPS.

24

25 The use of purpose-specific and validated formative assessment tools not only allows trainees and
26 trainers to facilitate targeted feedback, but also enables training programmes to set performance

1 benchmarks and profile competency development. The 24 items measured within each colonoscopy
2 DOPS provides the granularity to assess trainee progression in specific competency items. Data on
3 day-to-day, real-world evaluations of competency development using formative assessment tools are
4 lacking, especially those referencing the development of ENTS during colonoscopy training. In this
5 study, the 90% competency threshold was attained in order of: 'pre-procedure' (50-99 procedures),
6 'ENTS' and 'post-procedure' (150-199), 'management' (200-249) and 'procedure' (250-299) domain.
7 Such data appear to contrast that for gastroscopy where ENTS competencies developed after
8 technical competencies.²⁵ This finding could reflect the demands of colonoscopy as a more
9 technically-demanding procedure. As colonoscopy training may be preceded by training in
10 gastroscopy, it is possible that some of the generic competencies, e.g. ENTS, may be transferrable
11 between endoscopic modalities. At item-level, competencies in 'proactive problem solving' (rho
12 0.787) and 'loop management' (rho 0.780) correlated strongest with the overall DOPS rating ($P < 0.001$)
13 and were the last to develop. This approach identifies specific skills which could be considered for
14 prioritisation. It is possible that, with future evolution, ENTS and other more recently added items will
15 be further refined, which may influence the observed rate at which the inter-related endoscopy skills
16 develop in parallel.

17

18 Competency development during colonoscopy training has been profiled using completion-based
19 endpoints such as CIR, although its definition and calculation method may vary internationally.²⁶
20 Previous data from the UK JETS e-portfolio suggest that 233 lifetime procedures were required to
21 achieve 90%+ unassisted CIR,²⁷ with other studies citing between 141-300 procedures to achieve this
22 target.^{28,29} Consistent with data from ACE assessments reported by Sedlack et al,²² our trainees
23 developed cognitive competence on procedure "indications" after 100 procedures. The ACE cohort
24 reached competency thresholds for motor and cognitive endpoints after 250 procedures. For DOPS,
25 the 200-249 lifetime procedure count marked the point where trainees began to achieve consistent
26 unassisted CIRs of 90%+. At present, JAG mandates a minimum lifetime procedure count of 200 in

1 order to trigger summative assessment.¹⁰ Despite this, previous JETS analyses found that trainees
2 applied for provisional colonoscopy certification after a median of 269 (IQR 226 – 342) lifetime
3 procedures.¹³ Furthermore, it is evident that trainees certified closer to the 200 threshold are more
4 likely to exhibit a drop in performance during newly-independent practice.¹¹ As such, mandating a
5 minimum of 250 lifetime procedures may be suggested as a more appropriate criterion for triggering
6 summative assessment. For items of “proactive problem solving” and “loop resolution”, the 90%
7 threshold was not accomplished even after 300 procedures, suggesting that these skills would
8 continue to develop during the independent (post-credentialing) period. This may also explain why in
9 more difficult cases, lower rates of competent item scores are seen within the “procedure” domain.

10

11 Our study had several limitations. First, the colonoscopy DOPS is primarily centred on assessing a
12 trainee’s ability to perform high-quality diagnostic colonoscopy. Competencies relevant to
13 polypectomy are measured on a separate instrument: the direct observation of polypectomy skills
14 (DOPyS).³⁰ Second, this was a real-world observational study of unselected cases involving all trainees
15 from all centres within the UK. Colonoscopy in the UK is typically performed either under conscious
16 sedation (with midazolam +/- intravenous opioid) or unsedated, which may be more challenging than
17 training in healthcare settings where propofol is routinely administered. Third, competency
18 development was assessed at the level of each DOPS assessment rather than each trainee. As the
19 frequency and intervals of DOPS assessments varied amongst trainees, it was not appropriate to
20 subject these to trainee-level analyses, except for the GEE regression models. Fourth, the DOPS does
21 not collect procedure-specific data, e.g. sedation use, indication, diagnoses, complication rates etc.
22 These are currently collected on the JETS e-portfolio but are not cross-linked with DOPS. Efforts are
23 underway to integrate DOPS outcomes with procedural-level data. Lifetime colonoscopy counts were
24 deduced from trainee-entered procedure entries on the JETS e-portfolio, which may risk selection bias
25 and underestimate time-to-competency data. This is now being being addressed in the UK National
26 Endoscopy Database project where all procedures are centrally recorded.³¹ Finally, subgroup analyses

1 of DOPS competency rates were presented for gastroenterology and surgical specialties
2 (**Supplementary File 5-7**). This data should be interpreted with caution. Although there may have
3 been a trend for earlier competency development in surgical trainees, this difference did not remain
4 after multivariable GEE analysis (**Table 5**). This analysis also uncovered assessor variation, whereby
5 assessors from the GI surgical and non-medical (nurse) endoscopist specialties were more likely to
6 rate DOPS as being competent than those from the gastroenterology specialty. This raises the
7 possibility of assessor bias across trainer specialties. It is unclear whether this could reflect potential
8 differences in caseload, efficacy of training, or variation in assessor training in the use of DOPS. We
9 suspect that the stringency of gastroenterology assessors may arise from greater familiarity with
10 DOPS, in particular from attendance of Train-the-Trainers courses and Bowel Cancer Screening
11 accreditation where there is formal DOPS training. In these groups, there are proportionately far
12 greater numbers of gastroenterologists who train when compared to surgeons who train. Further
13 studies are needed to explore this further, in particular trainers' perceptions on the use of DOPS, and
14 to determine whether trainer interventions are necessary to improve the consistency of DOPS scoring.
15
16 Few competency assessment tools have undergone such rigorous evaluation to identify potential
17 heterogeneity on their usage. Multivariable regression models showed that, in addition to lifetime
18 procedure count and assessor specialty, other variables associated with DOPS competence included
19 DOPS count and easier case difficulty. Invariably, competency requires the demonstration of technical
20 and non-technical proficiencies across different cases contexts and procedural difficulties.³
21 Mandating higher combinations of trainers and assessments can improve the reliability of DOPS, with
22 sufficient reliability ($G > 0.70$) achievable with ≥ 3 assessors observing ≥ 2 DOPS each. Moreover,
23 engagement with the formative assessment process can promote feedback and reflective practice,
24 which may underpin the association between lifetime DOPS count and DOPS competency. With the
25 current spotlight fixed on high-quality colonoscopy in the remit of competency-based curricula,
26 training programmes are duty bound to ensure that competence is achievable, and that competency

1 elicited during the assessment process will effectively translate to competent clinical practice. The
2 delivery of this concept is supported by the observation that 99.5% of trainees who performed
3 competently within their last 5 formative DOPS, in conjunction with meeting minimum performance
4 indicators, also passed their summative assessments required for certification. Optimising the validity
5 and reliability of formative DOPS could potentially consolidate its role as an adjunctive training aid,
6 and in experienced trainees, as a pseudo-summative competency safeguard to quality assure training
7 in colonoscopy.

8

9 In summary, we provide validity and reliability evidence to support formative colonoscopy DOPS as
10 an in-training assessment tool, and present data on competency development, as measured using
11 DOPS.

All items	50.7% (49.4%-52.1%)	68.7% (67.3%-70.0%)	80.1% (79.0%-81.3%)	89.1% (88.2%-89.9%)	92.2% (91.2%-93.2%)	94.0% (92.9%-95.0%)	95.1% (94.2%-96.1%)

Table 4: Competency rates as measured by colonoscopy DOPS. *The percentage of DOPS scoring competent for each assessed item (with 95% confidence intervals) is presented for each stratum of lifetime colonoscopy count. Highlighted values denote those which have reached the competency threshold of 90%.*

Factor	N (%)	Multivariable Odds Ratio	95% Confidence Interval	p-value
Trainee Specialty				
Gastroenterology	4469 (65.1%)	REF		
GI Surgeon	2399 (34.9%)	1.09	0.73-1.65	0.665
Trainee Seniority				0.220
Junior	2933 (42.7%)	REF		
Senior	3589 (52.3%)	1.26	0.97-1.64	0.091
Clinical Research Fellow	346 (5.0%)	1.25	0.77-2.03	0.372
Lifetime Colonoscopy Count				<0.001
<50	1256 (18.3%)	REF

80+	1907 (27.8%)	0.97	0.74-1.27	0.812

Table 5: Multivariable analysis of in-training factors associated with competence in colonoscopy DOPS (overall DOPS rating achieving the competent outcome), based on 6868 DOPS performed by gastroenterology and GI surgical trainees. 1st to 3rd year specialty trainees (ST3-ST5) were classified as junior seniority and ST6+ as senior.

Generalised estimating equations were used to account for the non-independence of repeat DOPS by the same trainee. Bold p-values are significant at $p < 0.05$.
