Keynote Lecture: Practical and research challenges towards sustainable and resilient rail infrastructure systems

Dr Sakdirat Kaewunruen

Coordinator, Rail Infrastructure Systems Engineering Network (RISEN)

Senior Lecturer in Railway and Civil Engineering

Birmingham Centre for Railway Research and Education

The University of Birmingham

Summary.

This presentation presents recent collaborative research at the University of Birmingham in order to promote and encourage further collaboration in research, development and innovation in improving safety, reliability, resilience and sustainability in transportation and transit systems. Practical and research challenges to improve resilience and sustainability of railway infrastructure systems have been highlighted. The collaborative research are aligned with United Nation's Sustainable Development Goals, especially:

- Goal 9 Build resilient infrastructure, promote inclusive and sustainable industrialization and foster innovation;
- Goal 11. Make cities and human settlements inclusive, safe, resilient and sustainable;
- Goal 12. Ensure sustainable consumption and production patterns;
- Goal 13. Take urgent action to combat climate change and its impacts.

The presentation discusses a wide coverage of timely issues on railway track technologies and innovations focusing on broad aspects of rail infrastructure in order to address global grand challenges and UN's sustainable development goals with great social and economic importance. It enables new insights into advanced methods, technologies and concepts for the design, operations, construction and development towards sustainability of assets, infrastructures, as well as interdependent and interconnected rail transportation systems. The presentation will also provide highlights of world-class research and education at the University of Birmingham, U.K.

Acknowledgement.

This article is based on work from COST Action DENORMS CA15125 and TU1404, supported by COST (European Cooperation in Science and Technology). The author wishes to gratefully acknowledge the Japan Society for Promotion of Science (JSPS) for his JSPS Invitation Research Fellowship (Longterm), Grant No L15701, at Track Dynamics Laboratory, Railway Technical Research Institute and at Concrete Laboratory, the University of Tokyo, Tokyo, Japan. The JSPS financially supports this work as part of the research project, entitled "Smart and reliable railway infrastructure". The author would like to sincerely thank European Commission for H2020-MSCARISE Project No. 691135 "RISEN: Rail Infrastructure Systems Engineering Network," which enables a global research network that tackles the grand challenge in railway infrastructure resilience and advanced sensing under extreme conditions (www.risen2rail.eu).
