Morality, Normativity and Measuring Moral Distress

Abstract

It is known that people have been getting distressed for a long time and healthcare workers, like the military, seem to fit criteria for being at particular risk. Fairly recently a term of art, moral distress, has been added to types of distress at work, though not restricted to work, they can suffer. There are recognised scales that measure psychological distress such as the General Health Questionnaire and the Kessler scales but moral distress it is claimed is different warranting its own scale. This seems to be because of both the intensity and nature of moral problems encountered at work that is so powerful and so destructive of moral agency and integrity. This paper will focus on how, if at all, moral distress is different by examining the idea of moral normativity.

Moral normativity is understood as roughly the sort of thing that all rational persons would endorse regardless of his interests, having an 'automatic reason giving force' and is likely to also require an overriding force. Specifically, it will examine how this force of moral claims seems to be needed for moral distress to be so destructive of healthcare professional's moral agency and integrity. This is related to the idea of warrantedness of the reaction of distress. Even if morality had such a strong normativity one can still ask is distress the correct or warranted reaction? It seems plausible that if distress is a correct response for it to be both moral and warranted it needs a strong account of moral normativity. The idea of a distinct form of distress as moral distress may be true in theory but is too contested both ontologically and epistemologically for a useful practice of measurement at present.

Key words: Moral Normativity, Moral Distress, Psychological Distress, Definition

1
2
3 Unless it is said, implausibly, that all 'should' or 'ought' statements give reasons for acting,
4 which leaves the old problem of assigning a special categorical status to moral judgement,
5
6 we must be told what it is that makes the moral 'should' relevantly different from the
7
8 'shoulds' appearing in normative statements of other kinds (Foot, 1972, p. 309).
9
10

11
12 Similar to that of qualitative studies, this problem of different definitions compounds the
13
14 difficulty of developing adequate measures, since how a concept is defined matters greatly
15
16 in measurement (Hamric, 2012, p. 44).
17
18
19

20 Introduction

21
22 It is known that people have been getting distressed for a long time and healthcare workers, like the
23
24 military, seem to fit criteria for being at particular risk. Fairly recently a term of art, moral distress,
25
26 has been added to types of distress at work, though not restricted to work, they can suffer. An
27
28 example of how moral distress can arise is within the practice of palliative care (Maffoni et al, 2019).
29
30 This nicely brings out causes to do with the practice itself such as repeated exposure to dying and
31
32 death and complex decision making and causes that in a sense are not necessary or at least of a
33
34 different nature such as large workloads due to financial constraints. Both may ultimately adversely
35
36 affect patient care but have quite different causes. There are recognised scales that measure
37
38 psychological distress such as the General Health Questionnaire and the Kessler scales, but moral
39
40 distress is claimed to be different thus requiring its own scale (McCarthy and Gastmans, 2015). This
41
42 seems to be because of the nature of moral problems encountered at work that is so powerful and
43
44 so *destructive of moral agency and integrity* (Hamric, 2012, p.47 emphasis is mine). This paper will
45
46 focus on how, if at all, moral distress is different (Dudzinski, 2016) by examining the idea of moral
47
48 normativity.
49
50
51
52
53
54

55 For now, moral normativity is understood as more than the following of rules about what is correct
56
57 or allowed such as the rules of etiquette or codes (Parfitt, 2011). Such reasons may or may not be
58
59 categorical (Foot, 1972) in nature as being authoritative and inescapable for all rational persons
60

1
2
3 regardless of interests, having an 'automatic reason giving force' (Foot, 1972, p. 309; Luco, 2016).

4
5 Moral normativity is to be understood in a strong sense and is taken to be that moral reasons
6
7 because they are moral always 'override' non moral reasons (Hurley, 2017). Such strong moral
8
9 normativity is difficult to justify (Baker, 2018; Dorsey, 2016a) but it may be what is needed if moral
10
11 distress is to be sufficiently distinct from other types of distress and for it to be so destructive of
12
13 healthcare professional's moral agency and integrity and also for the reaction of distress to the
14
15 moral event to be appropriate . Questions then arise as to what sort of thing moral properties could
16
17 be to have such normative force and how we can know about them.
18
19

20
21 In a way, this paper is a supplement to the moral distress map of Dudzinski, 2016. It will use three
22
23 necessary and sufficient conditions for moral distress (Morley et al 2017) to structure the essay and
24
25 suggest that a fourth condition is needed if we want to reach a single definition. It is proposed, but
26
27 not discussed in any depth that we should stop trying to provide the definition of moral distress.
28
29 Instead, we should measure psychological distress to detect individuals scoring highly with the aim
30
31 of discussing with them the presumed causes of and consequent responses to this issue. After all
32
33 distress, but not necessarily stress, ought to be prevented or at least minimised. It perhaps even
34
35 creates a duty to prevent or minimise it.
36
37
38
39

40
41 In the present landscape, it may require further qualitative research exploring the understanding of
42
43 professional roles and their relationship to morality, moral theory, moral epistemology, and
44
45 especially moral compromise. Reflections in and on practice to help manage distress are also
46
47 suggested. The idea of a distinct form of distress as moral distress may be true in theory but is too
48
49 contested both ontologically and epistemologically for a useful practice of measurement at present.
50
51

52 The need for a definition of moral distress

53
54
55 The need for a definition of moral distress as a distinct type of distress has been raised in the nursing
56
57 and applied ethical literature (Dudzinski, 2016; Morley et al, 2017) broadly because it highlights the
58
59 moral labour of nursing and its often morally problematic relationship to organisational concerns
60

1
2
3 (Fourie, 2016; McCarthy and Gastmans, 2015). This need has been extended to other healthcare
4 professions and occupations (McCarthy and Monteverde, 2018) as well as other professions and
5 occupations such as business (De Tienne et al, 2012). The underlying concern seems to be related to
6 the fact that moral problems encountered at work may negatively affect a person's identity or the
7 sense of self and because of the moral aspect do so in a devastating way or at least a particularly
8 important way that encounters with non-moral problems do not. However, it is worth pointing out
9 that one's identity or sense of self can be grounded in non-moral values based on self-interest
10 (Taylor, 1992). There is also some reason to be a little wary of some accounts of identity and its
11 results (Breakey, 2016) so identity per se may not be the concern but perhaps appropriate identity.
12 Also, we do not fail to be a self if there is some dissonance in our integrity so the concern about
13 moral distress must be about its destructiveness (Hamric, 2012) of one's identity that is grounded in
14 moral concerns. This leaves open the question about what identity is and how do different aspects
15 of one's life relate to identity such as for example moral concerns and self-interested or prudential
16 concerns and probably involves accounts of normativity.

The focus on healthcare professions seems to be based on a claim that the work is directly moral
work or that what a healthcare professional does, and is, may be moral or at least strongly morally
infused (Pellegrino and Thomasma, 1981; Lazenby, 2020). Just to note, one potential cause of moral
distress can be conflict between the person and his professional role (Cribb, 2011; Thomas and
McCullough, 2015). Within nursing it is often held that they as a profession suffer especially from
moral distress because of their extensive accountability with limited authority (Davis and Aroskar,
1978; Morley et al 2019). This is tricky to understand. Apart from definitional concerns as to whether
one can be accountable without authority it can only be non-moral authority the nurse may lack not
moral authority. So, perhaps a nurse does not have the authority in law or in his employment to act
against the reasons of a doctor *ceteris paribus* or a more senior nurse. But moral authority is not
something that comes from one's professional, legal or employment status (Foot, 1972; McDowell,
1978; Crisp, 2006) and its authority has to do with its normativity; its reason giving force (Dorsey,

1
2
3 2016a). However, the idea of limited authority of nurses may relate to the idea of being constrained
4
5 in their actions. They can always do what they think is right or good, but there are pressures or
6
7 reasons not to do so. This point is related to the scope of the definition of moral distress, whether it
8
9 should be 'narrow' or 'broad' (Morley et al, 2019; McCarthy and Monteverde, 2018).

10
11
12 Definitions of moral distress are largely contested (Ulrich and Grady, 2018). Many researchers
13
14 advocate for a broader account than Jameton's original 'narrow' account as constrained moral
15
16 judgement (Fourie, 2017; Campbell et al, 2016; Morely et al, 2019). 'Account' rather than definition
17
18 is used because it is not clear that Jameton (1984) intended to provide a definition of moral distress
19
20 (John Paley in conversation). Since Wilkinson, (1987), definitions of moral distress have been given
21
22 that include as well as constraint, uncertainty and (moral) dilemmas (Fourie, 2017; Campbell et al,
23
24 2016). The differing definitions of moral distress given in the literature may mean that one is
25
26 measuring different things (Morley et al, 2017). This hinders attempts to help practitioners via the
27
28 use of empirical research.
29
30
31

32
33
34 Morley et al (2017) provide what is perhaps the broadest definition of moral distress via three
35
36 necessary and jointly sufficient conditions:

- 37
38 1. Experience of a moral event
- 39
40 2. Experience of psychological distress
- 41
42 3. A direct causal relation between 1 and 2.
- 43
44
45
46

47
48 On this account moral distress cannot occur without conditions 1, 2 and 3 and nothing else is needed
49
50 for moral distress to occur. All the definitions of moral distress given in the literature, narrow and
51
52 broad, fall under these three conditions. The three conditions are meant to give an account of what
53
54 moral distress is. However, as Morley et al, (2017) point out the breadth of the definition means
55
56 that it is not of practical use. This calls into question the attempt to give the definition of moral
57
58 distress as opposed to exploring the many senses it can have and although this point is not the
59
60

1
2
3 explicit focus of this paper what follows gives, I think, similar reasons. To help practitioners,
4
5 empirical work much of which will rely on measurement of moral distress, there needs be
6
7 agreement on what sort of event a moral event is and its relationship to psychological distress
8
9 (Morley et al, 2017). This is what much work on moral distress has been attempting to do resulting in
10
11 the narrow and broad definitions above, and it is likely that a number of distinct moral distress
12
13 scales will be necessary to cover the phenomena if it exists (Hamric, 2012); a practical problem in
14
15 itself but also one that again questions attempts to provide the definition of moral distress.
16
17

18
19 However, all seem to assume that it is clear what counts as a moral event so that moral distress can
20
21 be distinguished from other types or causes of psychological distress (Dudzinski, 2016; Morley et al
22
23 2017). Even if this can be done, and there are doubts that it can at least without substantive moral
24
25 enquiry (Dorsey, 2016a), the claim that moral distress is especially problematic needs justification
26
27 (Hamric, 2012). Relatedly and perhaps especially because of the practical need to relieve moral
28
29 distress suffered by professionals and others as much as possible the definition may require a fourth
30
31 necessary condition; 4. The distress is warranted or fitting or correct (Gert, 2017). Of course it is very
32
33 contested what is to count as fitting (Gert, 2017).
34
35
36

37
38 A moral event
39

40
41 Moral distress, assuming it exists, (though there is no doubt some or many people are becoming
42
43 distressed at work), is a very complex phenomenon. Thus, the attempt to operationalise and
44
45 measure this issue is difficult: morality is contested in part because of its normativity (Foot, 1972;
46
47 McDowell, 1978; Crisp, 2006; McPherson, 2018). Dorsey, 2016a give a list of five conditions that
48
49 might make morality a distinct domain and on which it is contested: content, ground, reactive
50
51 attitudes, motivation, and normativity.
52
53

54
55 Normativity can be divided into the evaluative (good, cruel etc.) and the deontic (right, ought)
56
57 (Skorupski, 2011). The virtue ethics literature may dispute the language of ought but not reasons
58
59 and rationality so normative force remains e.g. McDowell, 1978; Armstrong, 2006. Normativity
60

1
2
3 appears in many domains such as epistemology, and aesthetics as well as morality and is applied to
4
5 or is a part of many things including evaluations, reasons, and attitudes such as belief and desire. It is
6
7 usually contrasted with description. Moral normativity is thought by many to have a different sense
8
9 from other types of normativity being more than the fact that morality has moral authority and
10
11 prudence has prudential authority and etiquette has etiquette authority (Foot, 1972; Crisp, 2006;
12
13 Dorsey, 2016b). The extra something is its overridingness because it is moral; its normative force
14
15 (Dorsey 2016b). It is worth noting that the distinctiveness of morality or moral properties with or
16
17 without the overriding force is contested and thus what counts as a moral event is contested
18
19 (Dorsey, 2016b and 2016a).

20
21
22
23
24 The moral distress literature whilst attempting to claim that moral distress is a distinct entity in fact
25
26 only highlights the difficulties of distinguishing moral from other events. The claims made are very
27
28 similar that although experience of moral distress may involve emotions and psychological states, it
29
30 is not reducible to them or it is distinct from them or that moral distress should not be conflated
31
32 with psychological distress (McCarthy and Deady, 2018; Hanna, 2004). Psychological distress of
33
34 necessity has a cause, so it is hard to know what it means for something to be reducible to or the
35
36 same as or conflated with just psychological distress (McCarthy and Deady, 2008; Hanna, 2004).
37
38 Whatever and crucially assuming (possibly implausibly (Lazarus, 1999, 2006)) some one thing can be
39
40 singled out as the cause of the psychological distress, say X, then the distress is labelled X-distress.
41
42
43
44 An example from the literature illustrates this.

45
46
47 Psychiatric nurses may, for example, be emotionally distressed while restraining a patient,
48
49 but they are likely to become morally distressed only if they believe that restraining the
50
51 patient is morally wrong (McCarthy and Deady, 2008, p. 256).

52
53
54 Emotions themselves do not just happen, at least emotions that can in any sense be connected with
55
56 some form of cognition or appraisal rather than a knee jerk reaction, there is a cause or at least a
57
58 reason for them, especially some cognition of an event. So, it is not clear how emotional distress can
59
60

1
2
3 be a distinct thing rather than a result or effect of some other thing. One needs to ask why the
4
5 nurses experience emotional distress when restraining a patient. It is very plausible to think that it is
6
7 because of moral reasons or at least reasons that are associated with morality such as loss of
8
9 autonomy or freedom, or perhaps risk of physical harm or loss of dignity or even perhaps it affects
10
11 the nurses' and patient's wellbeing understood as moral. Or perhaps the reason for the emotional
12
13 distress is caused by something else such as tiredness. Perhaps there is no reason for it at all. So, it is
14
15 possible to hold that the psychiatric nurses' experience of emotional distress can fall under
16
17 conditions 1-3 and is a type of moral distress. Similarly, when trying to differentiate the need for an
18
19 account of moral distress from other types of distress Morley et al (2017) use the general example of
20
21 life events. But without stipulation that life events are not to include moral events this will not do.
22
23 Other more specific examples are family, or occupation. But again, without some explanation as to
24
25 when a family event or occupational event is not also a moral event this is problematic.
26
27

28
29 This issue is about the boundary of the moral and whilst this is contested in philosophy (Sinnott-
30
31 Armstrong and Wheatley, 2014; Dorsey, 2016b) it is important to know what is to count as a moral
32
33 event that makes X-distress moral distress. It is very important when moral distress is being applied
34
35 to healthcare because it is perhaps easier to make some connection of every action or event to
36
37 morality and thus claim to be a moral event. Some nurses, physicians and philosophers seem to
38
39 assume this at least for healthcare professional roles (Pellegrino and Thomasma, 1981; Lazenby
40
41 2020). This I think is reflected in difficulties of delimiting the items used within moral distress scales
42
43 as being all and only causes of moral distress. On such accounts it seems everything could be a
44
45 potential cause of moral distress thus there is nothing to be distinct and no need for a moral distress
46
47 scale. One could perhaps replace condition 1 above with 1a. Experience of an event; covering
48
49 anything that directly causes psychological distress which would then by definition be moral distress.
50
51 But unless the boundary problem can be resolved condition 1 is itself not helpful because, like 1a. it
52
53 could cover anything at all dependent upon what one takes a moral event to be. On such an account
54
55 condition 1 is equivalent to 1a.
56
57
58
59
60

1
2
3 A reason for the ease of moralising professional roles within healthcare has to do with the content of
4 morality as well as normativity. It seems plausible that morality is at least concerned with other
5 regarding content and to be distinct as morality and not for example etiquette has to do with the
6 others well-being (Dorsey, 2016a) although some accounts of virtue ethics it is directly about one's
7 own well-being or (enlightened) self-interest (Hursthouse, 1999). But here we get into details within
8 normative moral theory and it is not clear how for example some accounts of moral duty is
9 concerned with wellbeing. But within healthcare there seems to be a plausible connection between
10 what it as an institution does and morality. This is because either facts are equated or entangled
11 with values with a direct connection with ought (reasons) and the ought is to be understood as a
12 moral ought.
13
14

15
16 Healthcare can be an especially difficult area to disentangle description from values and the
17 normative because it has directly to do with living human beings where facts that are usually
18 understood as descriptions can easily become teleological evaluations based on biological function
19 which in turn is used to ground a should or ought but it need not be a moral should or ought or at
20 least it is contested (McDowell, 1998; Woodcock, 2006). A malfunctioning heart is bad and should be
21 repaired. If you want to be healthy then you should have your heart repaired. But it is one thing for
22 there to be such evaluative facts and another for there to be prescriptions of ought and should, that
23 follow from them and especially in a sense of normative force needed for morality to be distinct
24 from the non-moral. Neo-Aristotelian virtue ethics relies on this idea using examples of animals such
25 as owls claiming there is something wrong with an owl with poor sight then making an analogy with
26 the functioning of human beings and then stretching it include our rationality, note not morality
27 (Hursthouse, 1999; Foot, 2000). The point is made that there is a rational connection between what
28 is good for us and reasons for action though it is unlikely to be an overriding reason. It may be
29 claimed that the point of the institution of healthcare is this functional approach and thus it is its
30 main reason for practical decision making. But again, and nursing brings this out very well, it need
31 not be its overriding reason for action. There is often some tension between the role of healthcare
32
33
34
35
36
37
38
39
40
41
42
43
44
45
46
47
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 workers and the institution and ideas of autonomy and ultimate reason (Pellegrino and Thomasma,
4
5 1981).
6
7

8
9 Though it seems plausible that morality does have or could have a distinct content (but there is at
10
11 present no agreement on what it is) and thus there could be moral distress requiring a distinct scale
12
13 to measure it what it needs in addition is an account of its distinct normative force. The account of
14
15 good for above can be understood as a 'generic normativity' (Copp, 2004) that evaluative terms in
16
17 general possess. It may or may not also be understood as a hypothetical ought about well-being that
18
19 need not be understood as a moral notion or moral reason if moral reasons are taken to be
20
21 categorical reasons (which still may not distinguish moral reasons from reasons of etiquette). Taking
22
23 this medicine is, very probably, good for you so you ought to take it or have reason to take it if you
24
25 want to increase the probability of getting better (*ceteris paribus*). Science can provide the
26
27 probabilities about biological function and moral psychology can provide correlations between
28
29 virtues as traits that provide a good or a best bet for 'happiness' (Peterson and Seligman, 2004;
30
31 Kristjánsson, 2012; Risjord, 2005; but see Tiberius and Hall, 2010 for concern over psychology's lack
32
33 of concern over objective wellbeing). But on some accounts of morality and it's normativity being
34
35 good for is not sufficient or even necessary for its deontic force; what is needed is something like a
36
37 categorical ought or reason that is applicable to all rational beings irrespective of outcome. On other
38
39 accounts, morality as good for understood as the virtuous person's reasons, override, or silence
40
41 other reasons in practice (McDowell,1979; Vigani, 2019).
42
43
44
45
46

47
48 There is a stronger and weaker version. The weaker version being where the non-moral reasons
49
50 remain as reasons, but moral reasons always override them. On the stronger version where the
51
52 moral reasons are such that other reasons simply do not count as reasons. Moral normativity as
53
54 silencing would at least seem to warrant the idea of distress though it would need to explain how
55
56 the constraints were even taken to be reasons and why if moral reasons were silencing of all else
57
58 how there could be distress at all. Morality in this strong sense of normativity (Vogelstein, 2013) may
59
60

1
2
3 make moral distress a distinct type of psychological distress by clearly demarcating the moral from
4 the non-moral though it does so by blurring (many of) the very moral/non-moral differences.
5

6
7 Anything weaker makes it more difficult to justifiably distinguish a moral event from a non-moral
8 event or moral reasons from other reasons as well as the response that is distress. This is directly
9 related to condition 2 about causing psychological distress which seems to be a particularly
10 devastating type of distress and that only a very strong notion of normativity would seem to make
11 this appropriate. But now questions of meta-ethics are relevant about what sort of thing morality
12 can be to have such force especially where on some accounts it is independent from an agent's
13 psychology. It also raises issues about moral epistemology.
14

15
16 This sense of morality as 'strong moral rationalism' (Dorsey, 2016b) that is perhaps *suis generis* in
17 nature is hard to reconcile with a naturalistic morality (Majors, 2007), and thus hard to make use of
18 empirically when explaining the relationship between conditions 1, 2 and 3 or creating a scale to
19 measure it. Such a strong account of normativity would make actions or inactions cited in the moral
20 distress literature irrational. Though we can for practical purposes perhaps distinguish between a
21 rational person and a real person (Crisp, 2015a), strong moral rationalism reminds one of the need
22 for caution as to the role of emotions in morality; even Nussbaum (2003) claims they can be
23 unreliable. It is reason that seems to matter most (Crisp, 2006; Parfit, 2011) and it is unclear why or
24 how psychological distress is related to such a moral event at least for the practically wise. And even
25 on a weaker account of morality there is a problem of moral epistemology.
26

27
28 Even if a nurse, doctor, patient and relative agreed on all the facts they may still disagree as to what
29 evaluation to place on them. But even if they agreed on the facts and evaluation or agreed on the
30 'evaluative-facts' they may still disagree as to what ought to be done or what they have reason to do
31 because they may put different emphasis or weight on the same reasons. The normative force may
32 be felt quite differently, and this is regardless of the possibility that there could be a correct account.
33
34 In other words, there may be good reasons that differ in normative force about what should be done
35

1
2
3 held by people who care about the patient's well-being and for its own sake, not just because it is
4 part of their job or profession. Additionally, apart from the fact of moral disagreement which alone
5 should give one pause for thought about one's moral beliefs and judgement, on some accounts
6 within moral philosophy knowledge of these demands or the truth of moral reasons and its reason
7 giving force is intuitive (Crisp, 2015b) and justification *a priori* adding a further difficulty for empirical
8 work and it raises issues about condition 3 'causation' (Majors, 2007; Crisp, 2006).
9
10
11
12
13
14
15

16 17 Causation

18
19
20 Causation like morality is a contested concept whether it is cause between material objects or
21 between mental events and physical properties (Davidson, 1980). Lazarus' (1999) writing about
22 psychology and the emotions notes that in psychology a stimulus-response model was displaced by
23 stimulus- organism- response where organism included the mind in relation to behaviour/action part
24 of the relation being causal. He is wary of reductive analysis as all that is important for explanation
25 or even causation in psychology and a similar concern is related to the nature of moral properties to
26 natural ones. There is a large literature that attempts to 'naturalise' moral properties whilst
27 retaining its force so that instead of moral properties being decidedly odd (Mackie, 1977) , they are
28 just like any other properties that we think are not odd. Or else a naturalist account may deny
29 morality has a 'strong normativity' or an 'authoritative force' (Copp, 2004) but this leaves space for
30 the weight of reasons as to what to do could fall to prudence and not morality and this may affect
31 the idea of becoming distressed by not being able to act as one thinks one morally ought.
32
33
34
35
36
37
38
39
40
41
42
43
44
45
46
47

48 Even supervenience of the moral on the factual does not imply normative properties are caused by
49 the factual, the actual relationship is very contested (Hattiangadi, 2018), and condition 3 is
50 contested. Even the common term 'in virtue of' or 'response to' complicates the relation. If
51 causation is covered by natural laws, then the normative seems to disappear. The 'in virtue of
52 what?' did X cause Y question seems especially problematic for naturalistic moral explanations
53
54
55
56
57
58
59 (Sayre-McCord, 1988; Majors, 2003). Non-naturalistic moral realism seems to avoid the question of
60

1
2
3 causality (Majors, 2003) and in any case, if true, would make empirical work on moral distress
4 particularly difficult. Reductive moral realism removes any distinction needed for there to be moral
5 distress rather than psychological distress. Appeal to moral facts or properties to explain condition 3,
6 to causally affect us, is mysterious or at least highly contested. Crucially the mysteriousness is in the
7 main due to the need to accommodate the normativity of morality (*ibid.*). This difficulty for causal
8 explanations between a moral event and an effect that is psychological distress holds (I think) for
9 reasons understood as causes.

10
11
12
13
14
15
16
17
18
19 Reasons are normative and may be causes via an agent's beliefs and desires (Davidson, 1980;
20 Risjord, 2005). Plausibly there are moral reasons and so these it would seem can have a causal
21 effect. However psychological states are not reasons. For some accounts of morality this
22 necessitates 'agreement' by a community to constitute the beliefs and desires of the agent as norms
23 (or not) and thus reasons for an individual agent's beliefs and desires. However, as Risjord (2005)
24 explains, action explanations are not causal explanations, and this is important for understanding
25 the difficulty for condition 3. Beliefs and desires as causes are psychological facts about an agent and
26 the social status provided by the community is not part of the causal event:
27
28
29
30
31
32
33
34
35
36

37
38 X causally explains Y only if X is an event...in the causal history of Y (Risjord, 2005, p. 300).

39
40
41 One account that tries to give explanations for how belief and desire can be causes but not a causal
42 explanation is an erotetic model of explanation (Risjord, 2005). But the erotetic model of
43 explanation based as it is on both the ability to describe norms without thereby endorsing them and
44 community agreement on what reasons count as norms makes it problematic to meet condition 1,
45 which is the condition that distinguishes moral distress from non-moral psychological distress. This
46 can be illustrated using the relevance criteria used in the erotetic model. In intentional action
47 explanation the explananda accounts for the reason for the action based on the agent's pro attitude
48 (desires) and this is the relevance condition and it 'presupposes a normative relationship' (Risjord,
49 2005, 303 emphasis mine). What is the relevance criterion for condition 2 and how does it relate to
50
51
52
53
54
55
56
57
58
59
60

1
2
3 condition 1? Whilst it may seem plausible to account for intentional action by asking 'why?' and
4
5 presupposing some normative relationship it is less clear how this transfers or accounts for the
6
7 relationship between conditions 1 and 2 where the result or effect is psychological distress. The
8
9 point made in the previous paragraph as to how condition 3 holds remains.
10
11

12 13 Moral normativity and *distress*

14
15 There are psychological accounts of distress that include the evaluative as appraisal (Lazarus, 1999;
16
17 Moors, 2009) but such accounts blur or at least are unclear about any distinction between moral and
18
19 non-moral; psychology can include the evaluative but does not and should not extend to the
20
21 prescriptive where moral theory must (Crisp, 2006) and there is no agreement on what this is. A gap
22
23 in the form of a relationship remains between conditions 1, 2 and 3.
24
25

26
27 A brief note about constraint is warranted here because this is much discussed in the literature on
28
29 moral distress in relation to condition 3. I think McCarthy and Monteverde (2018) are correct that
30
31 constraint is relevantly different to moral dilemma and moral uncertainty as causes of condition 3
32
33 though presumably one could become psychologically distressed because of dilemma and
34
35 uncertainty and hence morally distressed. However, my guess is that we would be surprised if this
36
37 were the case; it just would not seem warranted. Moral authority as constraint is relevant here. Even
38
39 if one holds to the categorical force of morality as overriding morality is ultimately in the same boat
40
41 as that of the authority of law or of a profession; one can still go against it. But a strong categorical
42
43 account of moral normativity as overriding seems to warrant some strong response on the part of
44
45 the agent if he does not do as he thinks he morally should. This is assuming this can be the case and
46
47 the agent still does know the moral thing to do. 'Moral' in the weaker sense that equates with any
48
49 event causing distress can easily allow for balancing or weighing reasons with the reasons given by
50
51 people in authority. From a normative as general reasons approach it may be that the nurse (or
52
53 phronimos?) has judged that the reasons for acting or refraining from acting has he did are stronger
54
55 than or better than the 'moral' reasons. Relatedly if the cause of the distress is not constraint but for
56
57
58
59
60

1
2
3 example a dilemma or, differently, uncertainty the appropriateness of the distress as well as
4
5 responses to it and responsibility for the response will or should be different for epistemological
6
7 concerns connected with the ontological as appropriateness of response.
8
9

10 An idea in epistemology of 'pragmatic encroachment' (Fantl and McGrath, 2007) where roughly
11
12 whether a subject knows that p can vary due to differences in practical states such as the
13
14 importance or risk involved so that for example withdrawing life support from a patient with the
15
16 high probability of very quick death requires a greater strength of evidence than does thinking a
17
18 colleagues clinical competence is poor. It is of note that the literature on moral distress has raised a
19
20 similar concern changing the definition from knowing the right thing to do to something
21
22 epistemically weaker such as perceiving or believing or confusingly make clear moral judgements.
23
24 Even if this should not be the theoretical standard for knowledge it seems to have some practical
25
26 weight again related to the warrantedness or otherwise of the resulting distress.
27
28
29

30
31 Relatedly, Morley et al (2017) have usefully tabulated the many epistemological terms in use in the
32
33 literature on moral distress such as judgement, belief, knowledge, uncertainty and rightly suggests
34
35 that either they are all been used to mean judgement or they are taken to be different. This matters
36
37 for empirical work on moral distress because of the connection with reasons for action or not acting
38
39 and the associated psychological response. For instance, being certain or knowing that doing some
40
41 action is wrong and bad or vicious seems to have a different epistemological status to believing
42
43 which in turn differs from uncertainty. These different epistemological stances intuitively at least
44
45 require different psychological responses and different measurement scales.
46
47
48

49
50 Understanding the normative force of morality as categorical and overriding because of its special
51
52 normative prescriptive force, seems to justify the extreme emotional response that is distress, not
53
54 simply stress, when one does not do as it requires. The qualification seems to is important.
55

56 Knowledge of any objective thing, and for moral realism and more contentiously anti-anti realist
57
58 stances or response depend accounts, morality is objective, the epistemic and the ontological can
59
60

1
2
3 come apart such that it is (just) the construal by a nurse of the situation that causes his distress.

4
5 Although the distress is 'real', the nurse is suffering what we will call for now mental anguish and
6
7 probably physiological symptoms; it is not moral distress because it is not caused by a moral event.

8
9
10 Either because the nurse is mistaken in what he construes to be a moral event, or he is correct in his
11
12 construal but is mistaken in his reaction as response. Even response dependent accounts of morality,
13
14 where roughly the nature of moral properties is in a sense dependent on human being's responses,
15
16 attempt to provide critical distance between having the response and the response being merited
17
18 (warranted or appropriate) (D'Arms and Jacobson, 2000). It may be the correct or warranted
19
20 response should not be one of not distress but something else perhaps anger at oneself for
21
22 cowardice or anger at others for something, perhaps not agreeing with their own moral judgement.
23
24

25
26 In relation to objectivity of the moral there is also a further concern that a nurse may not recognise a
27
28 moral event and its warranting a certain response and thus will not lead to psychological distress on
29
30 his part even if it should do so. Literature suggests that this non-recognition of a moral event by
31
32 third persons is major cause of moral distress for individual nurses and is reflected in some of the
33
34 items in the moral distress scales. But there seems to be a double count on behalf of the agent first
35
36 person account suffering moral distress who must first recognise a moral event and know the
37
38 correct response and then know that the other agent as work colleague third person account either
39
40 can or differently should recognise what needs be the same moral event and respond appropriately
41
42 perhaps understood as the same as the first person. But some of the literature about moral
43
44 particularism especially on the holism of reasons (Hooker and Little, 2000) strongly suggests that for
45
46 example simply being a different person may itself change the moral valence of the situation, in
47
48 effect making the moral situation relevantly different. Even if the valence cannot change the agent's
49
50 reasons might. In fact, the issue is compounded because in the moral distress literature what is
51
52 taken to be problematic is the colleague's incompetence and so this must be in some sense moral
53
54 incompetence for it to be moral distress. Yet morality unlike say geology or anatomy has no
55
56 epistemological experts and thus it is much more difficult to judge a standard for competence.
57
58
59
60

1
2
3 Finally, it may be objected that even if distress is the wrong or inappropriate moral response it
4 seems that warranted or not the individual still experiences distress. An event or an action that at

55
56
57
58
59
60

Finally, it may be objected that even if distress is the wrong or inappropriate moral response it seems that warranted or not the individual still experiences distress. An event or an action that at least is perceived or, better, construed by the agent herself that causes distress directly perhaps also indirectly is practically significant. Distress is an evaluative term with no positive valence perhaps equivalent in sense to the latter end of Lazarus' (1999) notion of a continuum of stress through to trauma. This plausible account of the nature of distress as normative as evaluative, dependent upon not only input (cause) and output (response) but also mediating appraisal by the agent is important. The point here is that there is reason to relieve suffering however it is caused and thus reason to relieve distress.

This weaker account of normativity of evaluative reasons results in two things. First condition 1 needs replacing with 1a Experiencing an event. We may think that a completely irrational person has no reason that we can understand to feel distress even though the sheer fact that it is distress being felt warrants helping. This account of warranted helping may be labelled moral but if so then it is simply a placeholder for anything that causes distress and thus condition 1 can be replaced with 1a unless a clear distinction can be made. Second the evaluative is still normative and thus condition 4 is still necessary especially so since the point of this classificatory project is practical; to do something about healthcare workers (and others) psychological distress.

The warranted unwarranted distinction together with the current condition of moral epistemology has implications for responsibility for alleviation of the distress which may be institutional, professional, or individual. Constraint and its connection with moral responsibility is quite complex and has been discussed in moral philosophy for thousands of years. More recently perhaps, the issue of appropriate emotions and other psychological responses are once more to the fore (Nussbaum, 2003; Crisp, 2006). The strongest account of constraint would be something akin to being certain that X is the right thing to do but being physically prevented from doing so one cannot do it. Constraint in practice is always much weaker; the nurse can act or refrain from acting but there will

1
2
3 be well known potential or real costs in doing so; one might say reasons against doing so. It may be
4
5 the 'constraint' is actually or ultimately the nurse's cowardness; or the nurse has decided there are
6
7 better reasons not to act; or perhaps the nurse has, like almost all of us, not quite reached the mark
8
9 of the *phronimos* and is mistaken in his situational appreciation.
10
11

12
13 These points then raise an interesting question about the role of emotions for moral knowledge and
14
15 in this case for moral distress. Emotions can be recalcitrant remaining even when the nurse knows
16
17 that X or knows there are better reasons and yet still feels certain emotions of certain strength that
18
19 he now justifiably believes to be inappropriate. The nurse may initially feel distress but very quickly
20
21 realises that he should not. The distress as emotional response remains, and he knows it should not.
22
23

24 25 Conclusion

26
27 The need for a distinct account of moral distress is mainly practical and so some of this paper may
28
29 seem to miss the mark entirely. For some metaethical concerns need not have any relation to real
30
31 life practice but I doubt this is true. But even normative theories differ in accounts of what makes
32
33 something right or good some of which blur distinctions between moral and other events.
34
35

36
37 There is a need develop robust research studies that can be compared and where possible
38
39 aggregated. The idea is that they all use a similar or the same robust tool. These reasons are related
40
41 to the objective of remedying moral distress including being able to measure their effects (if any).
42
43

44 However, measurement scales for moral distress make the assumption that there is agreement on
45
46 what a moral event is and perhaps that it can be known *a posteriori*. The previous sections have at
47
48 least problematized this assumption of there being one thing that is moral distress, and which can
49
50 be clearly demarcated and thus problematizes the psychometrics of current moral distress scales. All
51
52 attempts to measure moral distress comes undone if no account of a moral event can be given that
53
54 ensures it is objective and statistically (at least) causes psychological distress. But more than
55
56 statistics is required and that something is normativity.
57
58
59
60

1
2
3 Relatedly a relational approach to understanding what stress (distress) is emphasises the
4 interrelationships of family and work stress as well as the importance of individual personality
5 variables for their effect. What causes stress reaction and what counts as a stressor is the
6 significance as appraised by the person encountering it (which may be subconscious). What is a
7 'daily hassle' (Kanner, et al 1981) for some is a very stressful perhaps even distressing event for
8 others. Better to take condition 1 a. and understand condition 2 as necessarily requiring an appraisal
9 by the individual, measure levels of perceived distress and then ask individuals about what it is they
10 think is causing their distress. I think a plausible summary will be unjustified suffering of patients.
11 Condition 4. Is necessary both because of its theoretical importance in defining a moral event but
12 also because of the practical need for doing so. Perhaps much of the remedy for moral distress will
13 be about the appropriateness or otherwise of the response to the event.

Morality, Normativity and Measuring Moral Distress

Abstract

It is known that people have been getting distressed for a long time and healthcare workers, like the military, seem to fit criteria for being at particular risk. Fairly recently a term of art, moral distress, has been added to types of distress at work, though not restricted to work, they can suffer. There are recognised scales that measure psychological distress such as the General Health Questionnaire and the Kessler scales but moral distress it is claimed is different warranting its own scale. This seems to be because of both the intensity and nature of moral problems encountered at work that is so powerful and so destructive of moral agency and integrity. This paper will focus on how, if at all, moral distress is different by examining the idea of moral normativity.

Moral normativity is understood as roughly the sort of thing that all rational persons would endorse regardless of his interests, having an 'automatic reason giving force' and is likely to also require an overriding force. Specifically, it will examine how this force of moral claims seems to be needed for moral distress to be so destructive of healthcare professional's moral agency and integrity. This is related to the idea of warrantedness of the reaction of distress. Even if morality had such a strong normativity one can still ask is distress the correct or warranted reaction? It seems plausible that if distress is a correct response for it to be both moral and warranted it needs a strong account of moral normativity. The idea of a distinct form of distress as moral distress may be true in theory but is too contested both ontologically and epistemologically for a useful practice of measurement at present.

Key words: Moral Normativity, Moral Distress, Psychological Distress, Definition

1
2
3
4
5
6
7
8
9
10 Unless it is said, implausibly, that all 'should' or 'ought' statements give reasons for acting,
11 which leaves the old problem of assigning a special categorical status to moral judgement,
12 we must be told what it is that makes the moral 'should' relevantly different from the
13 'shoulds' appearing in normative statements of other kinds (Foot, 1972, p. 309).

14
15
16
17 Similar to that of qualitative studies, this problem of different definitions compounds the
18 difficulty of developing adequate measures, since how a concept is defined matters greatly
19 in measurement (Hamric, 2012, p. 44).

22 Introduction

23
24 It is known that people have been getting distressed for a long time and healthcare workers, like the
25 military, seem to fit criteria for being at particular risk. Fairly recently a term of art, moral distress,
26 has been added to types of distress at work, though not restricted to work, they can suffer. An
27 example of how moral distress can arise is within the practice of palliative care (Maffoni et al, 2019).

28
29
30
31
32 This nicely brings out causes to do with the practice itself such as repeated exposure to dying and
33 death and complex decision making and causes that in a sense are not necessary or at least of a
34 different nature such as large workloads due to financial constraints. Both may ultimately adversely
35 affect patient care but have quite different causes. There are recognised scales that measure
36 psychological distress such as the General Health Questionnaire and the Kessler scales, but moral
37 distress is claimed to be different thus requiring its own scale (McCarthy and Gastmans, 2015). This
38 seems to be because of the nature of moral problems encountered at work that is so powerful and
39 so *destructive of moral agency and integrity* (Hamric, 2012, p.47 emphasis is mine). This paper will
40 focus on how, if at all, moral distress is different (Dudzinski, 2016) by examining the idea of moral
41 normativity.

42
43
44
45
46
47
48
49 For now, moral normativity is understood as more than the following of rules about what is correct
50 or allowed such as the rules of etiquette or codes (Parfitt, 2011). Such reasons may or may not be
51 categorical (Foot, 1972) in nature as being authoritative and inescapable for all rational persons
52

7
8
9
10 regardless of interests, having an 'automatic reason giving force' (Foot, 1972, p. 309; Luco, 2016).

11 Moral normativity is to be understood in a strong sense and is taken to be that moral reasons
12 because they are moral always 'override' non moral reasons (Hurley, 2017). Such strong moral
13 normativity is difficult to justify (Baker, 2018; Dorsey, 2016a) but it may be what is needed if moral
14 distress is to be sufficiently distinct from other types of distress and for it to be so destructive of
15 healthcare professional's moral agency and integrity and also for the reaction of distress to the
16 moral event to be appropriate. Questions then arise as to what sort of thing moral properties could
17 be to have such normative force and how we can know about them.
18
19
20
21
22
23

24 In a way, this paper is a supplement to the moral distress map of Dudzinski, 2016. It will use three
25 necessary and sufficient conditions for moral distress (Morley et al 2017) to structure the essay and
26 suggest that a fourth condition is needed if we want to reach a single definition. It is proposed, but
27 not discussed in any depth that we should stop trying to provide the definition of moral distress.
28 Instead, we should measure psychological distress to detect individuals scoring highly with the aim
29 of discussing with them the presumed causes of and consequent responses to this issue. After all
30 distress, but not necessarily stress, ought to be prevented or at least minimised. It perhaps even
31 creates a duty to prevent or minimise it.
32
33
34
35
36
37

38 In the present landscape, it may require further qualitative research exploring the understanding of
39 professional roles and their relationship to morality, moral theory, moral epistemology, and
40 especially moral compromise. Reflections in and on practice to help manage distress are also
41 suggested. The idea of a distinct form of distress as moral distress may be true in theory but is too
42 contested both ontologically and epistemologically for a useful practice of measurement at present.
43
44
45
46

47 The need for a definition of moral distress

48
49 The need for a definition of moral distress as a distinct type of distress has been raised in the nursing
50 and applied ethical literature (Dudzinski, 2016; Morley et al, 2017) broadly because it highlights the
51 moral labour of nursing and its often morally problematic relationship to organisational concerns
52
53
54
55
56
57
58
59
60

1
2
3
4
5
6
7
8
9
10 (Fourie, 2016; McCarthy and Gastmans, 2015). This need has been extended to other healthcare
11 professions and occupations (McCarthy and Monteverde, 2018) as well as other professions and
12 occupations such as business (De Tienne et al, 2012). The underlying concern seems to be related to
13 the fact that moral problems encountered at work may negatively affect a person's identity or the
14 sense of self and because of the moral aspect do so in a devastating way or at least a particularly
15 important way that encounters with non-moral problems do not. However, it is worth pointing out
16 that one's identity or sense of self can be grounded in non-moral values based on self-interest
17 (Taylor, 1992). There is also some reason to be a little wary of some accounts of identity and its
18 results (Breakey, 2016) so identity per se may not be the concern but perhaps appropriate identity.
19 Also, we do not fail to be a self if there is some dissonance in our integrity so the concern about
20 moral distress must be about its destructiveness (Hamric, 2012) of one's identity that is grounded in
21 moral concerns. This leaves open the question about what identity is and how do different aspects
22 of one's life relate to identity such as for example moral concerns and self-interested or prudential
23 concerns and probably involves accounts of normativity.

24
25
26
27
28
29
30
31
32
33
34 The focus on healthcare professions seems to be based on a claim that the work is directly moral
35 work or that what a healthcare professional does, and is, may be moral or at least strongly morally
36 infused (Pellegrino and Thomasma, 1981; Lazenby, 2020). Just to note, one potential cause of moral
37 distress can be conflict between the person and his professional role (Cribb, 2011; Thomas and
38 McCullough, 2015). Within nursing it is often held that they as a profession suffer especially from
39 moral distress because of their extensive accountability with limited authority (Davis and Aroskar,
40 1978; Morley et al 2019). This is tricky to understand. Apart from definitional concerns as to whether
41 one can be accountable without authority it can only be non-moral authority the nurse may lack not
42 moral authority. So, perhaps a nurse does not have the authority in law or in his employment to act
43 against the reasons of a doctor *ceteris paribus* or a more senior nurse. But moral authority is not
44 something that comes from one's professional, legal or employment status (Foot, 1972; McDowell,
45 1978; Crisp, 2006) and its authority has to do with its normativity; its reason giving force (Dorsey,

Commented [Roger New2]: Clarification of moral authority

Commented [Roger New3]: Same point

1
2
3
4
5
6
7
8
9
10 2016a). However, the idea of limited authority of nurses may relate to the idea of being constrained
11 in their actions. They can always do what they think is right or good, but there are pressures or
12 reasons not to do so. This point is related to the scope of the definition of moral distress, whether it
13 should be 'narrow' or 'broad' (Morley et al, 2019; McCarthy and Monteverde, 2018).

14
15
16
17 Definitions of moral distress are largely contested (Ulrich and Grady, 2018). Many researchers
18 advocate for a broader account than Jameton's original 'narrow' account as constrained moral
19 judgement (Fourie, 2017; Campbell et al, 2016; Morely et al, 2019). 'Account' rather than definition
20 is used because it is not clear that Jameton (1984) intended to provide a definition of moral distress
21 (John Paley in conversation). Since Wilkinson, (1987), definitions of moral distress have been given
22 that include as well as constraint, uncertainty and (moral) dilemmas (Fourie, 2017; Campbell et al,
23 2016). The differing definitions of moral distress given in the literature may mean that one is
24 measuring different things (Morley et al, 2017). This hinders attempts to help practitioners via the
25 use of empirical research.

26
27
28
29
30
31
32
33 Morley et al (2017) provide what is perhaps the broadest definition of moral distress via three
34 necessary and jointly sufficient conditions:

- 35 1. Experience of a moral event
- 36 2. Experience of psychological distress
- 37 3. A direct causal relation between 1 and 2.

38
39
40
41
42
43 On this account moral distress cannot occur without conditions 1, 2 and 3 and nothing else is needed
44 for moral distress to occur. All the definitions of moral distress given in the literature, narrow and
45 broad, fall under these three conditions. The three conditions are meant to give an account of what
46 moral distress is. However, as Morley et al, (2017) point out the breadth of the definition means
47 that it is not of practical use. This calls into question the attempt to give the definition of moral
48 distress as opposed to exploring the many senses it can have and although this point is not the
49

6
7
8
9
10 explicit focus of this paper what follows gives, I think, similar reasons. To help practitioners,
11 empirical work much of which will rely on measurement of moral distress, there needs be
12 agreement on what sort of event a moral event is and its relationship to psychological distress
13 (Morley et al, 2017). This is what much work on moral distress has been attempting to do resulting in
14 the narrow and broad definitions above, and it is likely that a number of distinct moral distress
15 scales will be necessary to cover the phenomena if it exists (Hamric, 2012); a practical problem in
16 itself but also one that again questions attempts to provide the definition of moral distress.

17
18 However, all seem to assume that it is clear what counts as a moral event so that moral distress can
19 be distinguished from other types or causes of psychological distress (Dudzinski, 2016; Morley et al
20 2017). Even if this can be done, and there are doubts that it can at least without substantive moral
21 enquiry (Dorsey, 2016a), the claim that moral distress is especially problematic needs justification
22 (Hamric, 2012). Relatedly and perhaps especially because of the practical need to relieve moral
23 distress suffered by professionals and others as much as possible the definition may require a fourth
24 necessary condition; 4. The distress is warranted or fitting or correct (Gert, 2017). Of course it is very
25 contested what is to count as fitting (Gert, 2017).

Commented [Roger New4]: Fittingness is contested

26
27
28
29
30
31
32
33
34
35
36 A moral event

37
38 Moral distress, assuming it exists, (though there is no doubt some or many people are becoming
39 distressed at work), is a very complex phenomenon. Thus, the attempt to operationalise and
40 measure this issue is difficult: morality is contested in part because of its normativity (Foot, 1972;
41 McDowell, 1978; Crisp, 2006; McPherson, 2018). Dorsey, 2016a give a list of five conditions that
42 might make morality a distinct domain and on which it is contested: content, ground, reactive
43 attitudes, motivation, and normativity.

44
45 Normativity can be divided into the evaluative (good, cruel etc.) and the deontic (right, ought)
46 (Skorupski, 2011). The virtue ethics literature may dispute the language of ought but not reasons
47 and rationality so normative force remains e.g. McDowell, 1978; Armstrong, 2006. Normativity

57
58
59
60

1
2
3
4
5
6
7
8
9
10 appears in many domains such as epistemology, and aesthetics as well as morality and is applied to
11 or is a part of many things including evaluations, reasons, and attitudes such as belief and desire. It is
12 usually contrasted with description. Moral normativity is thought by many to have a different sense
13 from other types of normativity being more than the fact that morality has moral authority and
14 prudence has prudential authority and etiquette has etiquette authority (Foot, 1972; Crisp, 2006;
15 Dorsey, 2016b). The extra something is its overridingness because it is moral; its normative force
16 (Dorsey 2016b). It is worth noting that the distinctiveness of morality or moral properties with or
17 without the overriding force is contested and thus what counts as a moral event is contested
18 (Dorsey, 2016b and 2016a).

19
20
21
22
23
24
25
26 The moral distress literature whilst attempting to claim that moral distress is a distinct entity in fact
27 only highlights the difficulties of distinguishing moral from other events. The claims made are very
28 similar that although experience of moral distress may involve emotions and psychological states, it
29 is not reducible to them or it is distinct from them or that moral distress should not be conflated
30 with psychological distress (McCarthy and Deady, 2018; Hanna, 2004). Psychological distress of
31 necessity has a cause, so it is hard to know what it means for something to be reducible to or the
32 same as or conflated with just psychological distress (McCarthy and Deady, 2008; Hanna, 2004).
33 Whatever and crucially assuming (possibly implausibly (Lazarus, 1999, 2006)) some one thing can be
34 singled out as the cause of the psychological distress, say X, then the distress is labelled X-distress.
35 An example from the literature illustrates this.

36
37
38
39
40
41
42
43 Psychiatric nurses may, for example, be emotionally distressed while restraining a patient,
44 but they are likely to become morally distressed only if they believe that restraining the
45 patient is morally wrong (McCarthy and Deady, 2008, p. 256).

46
47
48
49 Emotions themselves do not just happen, at least emotions that can in any sense be connected with
50 some form of cognition or appraisal rather than a knee jerk reaction, there is a cause or at least a
51 reason for them, especially some cognition of an event. So, it is not clear how emotional distress can
52
53
54
55

57
58
59
60

1
2
3
4
5
6
7
8
9
10 be a distinct thing rather than a result or effect of some other thing. One needs to ask why the
11 nurses experience emotional distress when restraining a patient. It is very plausible to think that it is
12 because of moral reasons or at least reasons that are associated with morality such as loss of
13 autonomy or freedom, or perhaps risk of physical harm or loss of dignity or even perhaps it affects
14 the nurses' and patient's wellbeing understood as moral. Or perhaps the reason for the emotional
15 distress is caused by something else such as tiredness. Perhaps there is no reason for it at all. So, it is
16 possible to hold that the psychiatric nurses' experience of emotional distress can fall under
17 conditions 1-3 and is a type of moral distress. Similarly, when trying to differentiate the need for an
18 account of moral distress from other types of distress Morley et al (2017) use the general example of
19 life events. But without stipulation that life events are not to include moral events this will not do.
20 Other more specific examples are family, or occupation. But again, without some explanation as to
21 when a family event or occupational event is not also a moral event this is problematic.
22
23 This issue is about the boundary of the moral and whilst this is contested in philosophy (Sinnott-
24 Armstrong and Wheatley, 2014; Dorsey, 2016b) it is important to know what is to count as a moral
25 event that makes X-distress moral distress. It is very important when moral distress is being applied
26 to healthcare because it is perhaps easier to make some connection of every action or event to
27 morality and thus claim to be a moral event. Some nurses, physicians and philosophers seem to
28 assume this at least for healthcare professional roles (Pellegrino and Thomasma, 1981; Lazenby
29 2020). This I think is reflected in difficulties of delimiting the items used within moral distress scales
30 as being all and only causes of moral distress. On such accounts it seems everything could be a
31 potential cause of moral distress thus there is nothing to be distinct and no need for a moral distress
32 scale. One could perhaps replace condition 1 above with 1a. Experience of an event; covering
33 anything that directly causes psychological distress which would then by definition be moral distress.
34 But unless the boundary problem can be resolved condition 1 is itself not helpful because, like 1a. it
35 could cover anything at all dependent upon what one takes a moral event to be. On such an account
36 condition 1 is equivalent to 1a.

9
10 A reason for the ease of moralising professional roles within healthcare has to do with the content of
11 morality as well as normativity. It seems plausible that morality is at least concerned with other
12 regarding content and to be distinct as morality and not for example etiquette has to do with the
13 others well-being (Dorsey, 2016a) although some accounts of virtue ethics it is directly about one's
14 own well-being or (enlightened) self-interest (Hursthouse, 1999). But here we get into details within
15 normative moral theory and it is not clear how for example some accounts of moral duty is
16 concerned with wellbeing. But within healthcare there seems to be a plausible connection between
17 what it as an institution does and morality. This is because either facts are equated or entangled
18 with values with a direct connection with ought (reasons) and the ought is to be understood as a
19 moral ought.

Commented [Roger New5]: Clarification.

20
21
22
23
24
25
26
27 Healthcare can be an especially difficult area to disentangle description from values and the
28 normative because it has directly to do with living human beings where facts that are usually
29 understood as descriptions can easily become teleological evaluations based on biological function
30 which in turn is used to ground a should or ought but it need not be a moral should or ought or at
31 least it is contested (McDowell, 1998; Woodcock, 2006). A malfunctioning heart is bad and should be
32 repaired. If you want to be healthy then you should have your heart repaired. But it is one thing for
33 there to be such evaluative facts and another for there to be prescriptions of ought and should, that
34 follow from them and especially in a sense of normative force needed for morality to be distinct
35 from the non-moral. Neo-Aristotelian virtue ethics relies on this idea using examples of animals such
36 as owls claiming there is something wrong with an owl with poor sight then making an analogy with
37 the functioning of human beings and then stretching it include our rationality, note not morality
38 (Hursthouse, 1999; Foot, 2000). The point is made that there is a rational connection between what
39 is good for us and reasons for action though it is unlikely to be an overriding reason. It may be
40 claimed that the point of the institution of healthcare is this functional approach and thus it is its
41 main reason for practical decision making. But again, and nursing brings this out very well, it need
42 not be its overriding reason for action. There is often some tension between the role of healthcare

10 workers and the institution and ideas of autonomy and ultimate reason (Pellegrino and Thomasma,
11 1981).

12
13
14 Though it seems plausible that morality does have or could have a distinct content (but there is at
15 present no agreement on what it is) and thus there could be moral distress requiring a distinct scale
16 to measure it what it needs in addition is an account of its distinct normative force. The account of
17 good for above can be understood as a 'generic normativity' (Copp, 2004) that evaluative terms in
18 general possess. It may or may not also be understood as a hypothetical ought about well-being that
19 need not be understood as a moral notion or moral reason if moral reasons are taken to be
20 categorical reasons (which still may not distinguish moral reasons from reasons of etiquette). Taking
21 this medicine is, very probably, good for you so you ought to take it or have reason to take it if you
22 want to increase the probability of getting better (*ceteris paribus*). Science can provide the
23 probabilities about biological function and moral psychology can provide correlations between
24 virtues as traits that provide a good or a best bet for 'happiness' (Peterson and Seligman, 2004;
25 Kristjánsson, 2012; Risjord, 2005; but see Tiberius and Hall, 2010 for concern over psychology's lack
26 of concern over objective wellbeing). But on some accounts of morality and it's normativity being
27 good for is not sufficient or even necessary for its deontic force; what is needed is something like a
28 categorical ought or reason that is applicable to all rational beings irrespective of outcome. On other
29 accounts, morality as good for understood as the virtuous person's reasons, override, or silence
30 other reasons in practice (McDowell,1979; Vigan, 2019).

43 There is a stronger and weaker version. The weaker version being where the non-moral reasons
44 remain as reasons, but moral reasons always override them. On the stronger version where the
45 moral reasons are such that other reasons simply do not count as reasons. Moral normativity as
46 silencing would at least seem to warrant the idea of distress though it would need to explain how
47 the constraints were even taken to be reasons and why if moral reasons were silencing of all else
48 how there could be distress at all. Morality in this strong sense of normativity (Vogelstein, 2013) may
49

10 make moral distress a distinct type of psychological distress by clearly demarcating the moral from
11 the non-moral though it does so by blurring (many of) the very moral/non-moral differences.

12
13 Anything weaker makes it more difficult to justifiably distinguish a moral event from a non-moral
14 event or moral reasons from other reasons as well as the response that is distress. This is directly
15 related to condition 2 about causing psychological distress which seems to be a particularly
16 devastating type of distress and that only a very strong notion of normativity would seem to make
17 this appropriate. But now questions of meta-ethics are relevant about what sort of thing morality
18 can be to have such force especially where on some accounts it is independent from an agent's
19 psychology. It also raises issues about moral epistemology.

20
21 This sense of morality as 'strong moral rationalism' (Dorsey, 2016b) that is perhaps *suis generis* in
22 nature is hard to reconcile with a naturalistic morality (Majors, 2007), and thus hard to make use of
23 empirically when explaining the relationship between conditions 1, 2 and 3 or creating a scale to
24 measure it. Such a strong account of normativity would make actions or inactions cited in the moral
25 distress literature irrational. Though we can for practical purposes perhaps distinguish between a
26 rational person and a real person (Crisp, 2015a), strong moral rationalism reminds one of the need
27 for caution as to the role of emotions in morality; even Nussbaum (2003) claims they can be
28 unreliable. It is reason that seems to matter most (Crisp, 2006; Parfit, 2011) and it is unclear why or
29 how psychological distress is related to such a moral event at least for the practically wise. And even
30 on a weaker account of morality there is a problem of moral epistemology.

31
32 Even if a nurse, doctor, patient and relative agreed on all the facts they may still disagree as to what
33 evaluation to place on them. But even if they agreed on the facts and evaluation or agreed on the
34 'evaluative-facts' they may still disagree as to what ought to be done or what they have reason to do
35 because they may put different emphasis or weight on the same reasons. The normative force may
36 be felt quite differently, and this is regardless of the possibility that there could be a correct account.
37 In other words, there may be good reasons that differ in normative force about what should be done

10 held by people who care about the patient's well-being and for its own sake, not just because it is
11 part of their job or profession. Additionally, apart from the fact of moral disagreement which alone
12 should give one pause for thought about one's moral beliefs and judgement, on some accounts
13 within moral philosophy knowledge of these demands or the truth of moral reasons and its reason
14 giving force is intuitive (Crisp, 2015b) and justification *a priori* adding a further difficulty for empirical
15 work and it raises issues about condition 3 'causation' (Majors, 2007; Crisp, 2006).

20 Causation

21
22 Causation like morality is a contested concept whether it is cause between material objects or
23 between mental events and physical properties (Davidson, 1980). Lazarus' (1999) writing about
24 psychology and the emotions notes that in psychology a stimulus-response model was displaced by
25 stimulus- organism- response where organism included the mind in relation to behaviour/action part
26 of the relation being causal. He is wary of reductive analysis as all that is important for explanation
27 or even causation in psychology and a similar concern is related to the nature of moral properties to
28 natural ones. There is a large literature that attempts to 'naturalise' moral properties whilst
29 retaining its force so that instead of moral properties being decidedly odd (Mackie, 1977) , they are
30 just like any other properties that we think are not odd. Or else a naturalist account may deny
31 morality has a 'strong normativity' or an 'authoritative force' (Copp, 2004) but this leaves space for
32 the weight of reasons as to what to do could fall to prudence and not morality and this may affect
33 the idea of becoming distressed by not being able to act as one thinks one morally ought.

34
35 Even supervenience of the moral on the factual does not imply normative properties are caused by
36 the factual, the actual relationship is very contested (Hattiangadi, 2018), and condition 3 is
37 contested. Even the common term 'in virtue of' or 'response to' complicates the relation. If
38 causation is covered by natural laws, then the normative seems to disappear. The 'in virtue of
39 what?' did X cause Y question seems especially problematic for naturalistic moral explanations
40 (Sayre-McCord, 1988; Majors, 2003). Non-naturalistic moral realism seems to avoid the question of

4
5
6
7
8
9
10 causality (Majors, 2003) and in any case, if true, would make empirical work on moral distress
11 particularly difficult. Reductive moral realism removes any distinction needed for there to be moral
12 distress rather than psychological distress. Appeal to moral facts or properties to explain condition 3,
13 to causally affect us, is mysterious or at least highly contested. Crucially the mysteriousness is in the
14 main due to the need to accommodate the normativity of morality (*ibid.*). This difficulty for causal
15 explanations between a moral event and an effect that is psychological distress holds (I think) for
16 reasons understood as causes.
17

18
19
20
21
22 Reasons are normative and may be causes via an agent's beliefs and desires (Davidson, 1980;
23 Risjord, 2005). Plausibly there are moral reasons and so these it would seem can have a causal
24 effect. However psychological states are not reasons. For some accounts of morality this
25 necessitates 'agreement' by a community to constitute the beliefs and desires of the agent as norms
26 (or not) and thus reasons for an individual agent's beliefs and desires. However, as Risjord (2005)
27 explains, action explanations are not causal explanations, and this is important for understanding
28 the difficulty for condition 3. Beliefs and desires as causes are psychological facts about an agent and
29 the social status provided by the community is not part of the causal event:
30
31
32
33
34
35

36 X causally explains Y only if X is an event...in the causal history of Y (Risjord, 2005, p. 300).

37
38
39 One account that tries to give explanations for how belief and desire can be causes but not a causal
40 explanation is an erotetic model of explanation (Risjord, 2005). But the erotetic model of
41 explanation based as it is on both the ability to describe norms without thereby endorsing them and
42 community agreement on what reasons count as norms makes it problematic to meet condition 1,
43 which is the condition that distinguishes moral distress from non-moral psychological distress. This
44 can be illustrated using the relevance criteria used in the erotetic model. In intentional action
45 explanation the explananda accounts for the reason for the action based on the agent's pro attitude
46 (desires) and this is the relevance condition and it 'presupposes a normative relationship' (Risjord,
47 2005, 303 emphasis mine). What is the relevance criterion for condition 2 and how does it relate to

9
10 condition 1? Whilst it may seem plausible to account for intentional action by asking 'why?' and
11 presupposing some normative relationship it is less clear how this transfers or accounts for the
12 relationship between conditions 1 and 2 where the result or effect is psychological distress. The
13 point made in the previous paragraph as to how condition 3 holds remains.
14
15

16 17 Moral normativity and *distress*

18
19 There are psychological accounts of distress that include the evaluative as appraisal (Lazarus, 1999;
20 Moors, 2009) but such accounts blur or at least are unclear about any distinction between moral and
21 non-moral; psychology can include the evaluative but does not and should not extend to the
22 prescriptive where moral theory must (Crisp, 2006) and there is no agreement on what this is. A gap
23 in the form of a relationship remains between conditions 1, 2 and 3.
24
25

26
27 A brief note about constraint is warranted here because this is much discussed in the literature on
28 moral distress in relation to condition 3. I think McCarthy and Monteverde (2018) are correct that
29 constraint is relevantly different to moral dilemma and moral uncertainty as causes of condition 3
30 though presumably one could become psychologically distressed because of dilemma and
31 uncertainty and hence morally distressed. However, my guess is that we would be surprised if this
32 were the case; it just would not seem warranted. Moral authority as constraint is relevant here. Even
33 if one holds to the categorical force of morality as overriding morality is ultimately in the same boat
34 as that of the authority of law or of a profession; one can still go against it. But a strong categorical
35 account of moral normativity as overriding seems to warrant some strong response on the part of
36 the agent if he does not do as he thinks he morally should. This is assuming this can be the case and
37 the agent still does know the moral thing to do. 'Moral' in the weaker sense that equates with any
38 event causing distress can easily allow for balancing or weighing reasons with the reasons given by
39 people in authority. From a normative as general reasons approach it may be that the nurse (or
40 phronimos?) has judged that the reasons for acting or refraining from acting has he did are stronger
41 than or better than the 'moral' reasons. Relatedly if the cause of the distress is not constraint but for

10 example a dilemma or, differently, uncertainty the appropriateness of the distress as well as
11 responses to it and responsibility for the response will or should be different for epistemological
12 concerns connected with the ontological as appropriateness of response.
13
14

15 An idea in epistemology of 'pragmatic encroachment' (Fantl and McGrath, 2007) where roughly
16 whether a subject knows that p can vary due to differences in practical states such as the
17 importance or risk involved so that for example withdrawing life support from a patient with the
18 high probability of very quick death requires a greater strength of evidence than does thinking a
19 colleagues clinical competence is poor. It is of note that the literature on moral distress has raised a
20 similar concern changing the definition from knowing the right thing to do to something
21 epistemically weaker such as perceiving or believing or confusingly make clear moral judgements.
22 Even if this should not be the theoretical standard for knowledge it seems to have some practical
23 weight again related to the warrantedness or otherwise of the resulting distress.
24
25
26
27
28
29
30

31 Relatedly, Morley et al (2017) have usefully tabulated the many epistemological terms in use in the
32 literature on moral distress such as judgement, belief, knowledge, uncertainty and rightly suggests
33 that either they are all been used to mean judgement or they are taken to be different. This matters
34 for empirical work on moral distress because of the connection with reasons for action or not acting
35 and the associated psychological response. For instance, being certain or knowing that doing some
36 action is wrong and bad or vicious seems to have a different epistemological status to believing
37 which in turn differs from uncertainty. These different epistemological stances intuitively at least
38 require different psychological responses and different measurement scales.
39
40
41
42
43
44

45 Understanding the normative force of morality as categorical and overriding because of its special
46 normative prescriptive force, seems to justify the extreme emotional response that is distress, not
47 simply stress, when one does not do as it requires. The qualification seems to be important.
48

49 Knowledge of any objective thing, and for moral realism and more contentiously anti-anti realist
50 stances or response depend accounts, morality is objective, the epistemic and the ontological can

construal but is mistaken in his reaction as response. Even response dependent accounts of morality,
where roughly the nature of moral properties is in a sense dependent on human being's responses,
attempt to provide critical distance between having the response and the response being merited
(warranted or appropriate) (D'Arms and Jacobson, 2000). It may be the correct or warranted
response should not be one of not distress but something else perhaps anger at oneself for
cowardice or anger at others for something, perhaps not agreeing with their own moral judgement.

In relation to objectivity of the moral there is also a further concern that a nurse may not recognise a
moral event and its warranting a certain response and thus will not lead to psychological distress on
his part even if it should do so. Literature suggests that this non-recognition of a moral event by
third persons is major cause of moral distress for individual nurses and is reflected in some of the
items in the moral distress scales. But there seems to be a double count on behalf of the agent first
person account suffering moral distress who must first recognise a moral event and know the
correct response and then know that the other agent as work colleague third person account either
can or differently should recognise what needs be the same moral event and respond appropriately
perhaps understood as the same as the first person. But some of the literature about moral
particularism especially on the holism of reasons (Hooker and Little, 2000) strongly suggests that for
example simply being a different person may itself change the moral valence of the situation, in
effect making the moral situation relevantly different. Even if the valence cannot change the agent's
reasons might. In fact, the issue is compounded because in the moral distress literature what is
taken to be problematic is the colleague's incompetence and so this must be in some sense moral
incompetence for it to be moral distress. Yet morality unlike say geology or anatomy has no
epistemological experts and thus it is much more difficult to judge a standard for competence.

1
2
3
4
5
6
7
8
9
10 Finally, it may be objected that even if distress is the wrong or inappropriate moral response it
11 seems that warranted or not the individual still experiences distress. An event or an action that at
12 least is perceived or, better, construed by the agent herself that causes distress directly perhaps also
13 indirectly is practically significant. Distress is an evaluative term with no positive valence perhaps
14 equivalent in sense to the latter end of Lazarus' (1999) notion of a continuum of stress through to
15 trauma. This plausible account of the nature of distress as normative as evaluative, dependent upon
16 not only input (cause) and output (response) but also mediating appraisal by the agent is important.
17 The point here is that there is reason to relieve suffering however it is caused and thus reason to
18 relieve distress.
19

20 This weaker account of normativity of evaluative reasons results in two things. First condition 1
21 needs replacing with 1a Experiencing an event. We may think that a completely irrational person has
22 no reason that we can understand to feel distress even though the sheer fact that it is distress being
23 felt warrants helping. This account of warranted helping may be labelled moral but if so then it is
24 simply a placeholder for anything that causes distress and thus condition 1 can be replaced with 1a
25 unless a clear distinction can be made. Second the evaluative is still normative and thus condition 4
26 is still necessary especially so since the point of this classificatory project is practical; to do
27 something about healthcare workers (and others) psychological distress.
28

29 The warranted unwarranted distinction together with the current condition of moral epistemology
30 has implications for responsibility for alleviation of the distress which may be institutional,
31 professional, or individual. Constraint and its connection with moral responsibility is quite complex
32 and has been discussed in moral philosophy for thousands of years. More recently perhaps, the issue
33 of appropriate emotions and other psychological responses are once more to the fore (Nussbaum,
34 2003; Crisp, 2006). The strongest account of constraint would be something akin to being certain
35 that X is the right thing to do but being physically prevented from doing so one cannot do it.
36

37 Constraint in practice is always much weaker; the nurse can act or refrain from acting but there will

10 be well known potential or real costs in doing so; one might say reasons against doing so. It may be
11 the 'constraint' is actually or ultimately the nurse's cowardness; or the nurse has decided there are
12 better reasons not to act; or perhaps the nurse has, like almost all of us, not quite reached the mark
13 of the *phronimos* and is mistaken in his situational appreciation.
14
15

16
17 These points then raise an interesting question about the role of emotions for moral knowledge and
18 in this case for moral distress. Emotions can be recalcitrant remaining even when the nurse knows
19 that X or knows there are better reasons and yet still feels certain emotions of certain strength that
20 he now justifiably believes to be inappropriate. The nurse may initially feel distress but very quickly
21 realises that he should not. The distress as emotional response remains, and he knows it should not.
22
23
24
25

26 Conclusion

27
28 The need for a distinct account of moral distress is mainly practical and so some of this paper may
29 seem to miss the mark entirely. For some metaethical concerns need not have any relation to real
30 life practice but I doubt this is true. But even normative theories differ in accounts of what makes
31 something right or good some of which blur distinctions between moral and other events.
32
33
34

35
36 There is a need develop robust research studies that can be compared and where possible
37 aggregated. The idea is that they all use a similar or the same robust tool. These reasons are related
38 to the objective of remedying moral distress including being able to measure their effects (if any).
39 However, measurement scales for moral distress make the assumption that there is agreement on
40 what a moral event is and perhaps that it can be known *a posteriori*. The previous sections have at
41 least problematized this assumption of there being one thing that is moral distress, and which can
42 be clearly demarcated and thus problematizes the psychometrics of current moral distress scales. All
43 attempts to measure moral distress comes undone if no account of a moral event can be given that
44 ensures it is objective and statistically (at least) causes psychological distress. But more than
45 statistics is required and that something is normativity.

Relatedly a relational approach to understanding what stress (distress) is emphasises the interrelationships of family and work stress as well as the importance of individual personality variables for their effect. What causes stress reaction and what counts as a stressor is the significance as appraised by the person encountering it (which may be subconscious). What is a 'daily hassle' (Kanner, et al 1981) for some is a very stressful perhaps even distressing event for others. Better to take condition 1 a. and understand condition 2 as necessarily requiring an appraisal by the individual, measure levels of perceived distress and then ask individuals about what it is they think is causing their distress. I think a plausible summary will be unjustified suffering of patients. Condition 4. Is necessary both because of its theoretical importance in defining a moral event but also because of the practical need for doing so. Perhaps much of the remedy for moral distress will be about the appropriateness or otherwise of the response to the event.
